New in 14

AMI

- A new event, DialState has been added. This is similar to DialBegin and DialEnd in that it tracks the state of a dialed call. The difference is that this indicates some intermediate state change in the dial attempt, such as “RINGING”, “PROGRESS”, or “PROCEEDING”.

ARI

- A new ARI method has been added to the channels resource. "create" allows for you to create a new channel and place that channel into a Stasis application. This is similar to origination except that the specified channel is not dialed. This allows for an application writer to create a channel, perform manipulations on it, and then delay dialing the channel until later.
- To complement the "create" method, a "dial" method has been added to the channels resource in order to place a call to a created channel.
- All operations that initiate playback of media on a resource now support a list of media URIs. The list of URIs are played in the order they are presented to the resource. A new event, PlaybackContinuing, is raised when a media URI finishes but before the next media URI starts. When a list is played, the “Playback” model will contain the optional attribute next_media_uri, which specifies the next media URI in the list to be played back to the resource. The PlaybackFinished event is raised when all media URIs are done.
- Stored recordings now allow for the media associated with a stored recording to be retrieved. The new route, {{ GET /recordings/stored/{name}/file }}, will transmit the raw media file to the requester as binary.
- Dial events have been modified to not only be sent when dialing begins and ends. They now are also sent for intermediate states, such as "RINGING", "PROGRESS", and "PROCEEDING".

Applications

BridgeAdd

- A new application in Asterisk, this will join the calling channel to an existing bridge containing the named channel prefix.

ChanSpy

- Added the 1 option, which forces ChanSpy’s audiohook to use a long queue to store the audio frames. This option is useful if audio loss is experienced when using ChanSpy, but may introduce some delay in the audio feed on the listening channel.

ConfBridge

- Added the ability to pass options to MixMonitor when recording is used with ConfBridge. This includes the addition of the following configuration parameters for the ‘bridge’ object:
  - record_file_timestamp: whether or not to append the start time to the recorded file name
  - record_options: the options to pass to the MixMonitor application
  - record_command: a command to execute when recording is finished
  Note that these options may also be with the CONFBRIDGE function.

ControlPlayback

- Remote files can now be retrieved and played back. See the Playback dialplan application for more details.

FollowMe

- It is now possible to disable the prompt from a callee by setting enable_callee_prompt = no in followme.conf.

Playback

- Remote files can now be retrieved and played back via the Playback and other media playback dialplan applications. This is done by directly providing the URL to play to the dialplan application:
  ```plaintext
  same => n,Playback(http://1.1.1.1/howler-monkeys-fl.wav)
  ```
Note that unlike 'normal' media files, the entire URI to the file must be provided, including the file extension. Currently, on HTTP and HTTPS URI schemes are supported.

Queue

- Added field ReasonPause on QueueMemberStatus if set when paused, the reason the queue member was paused.
- Added field LastPause on QueueMemberStatus for time when started the last pause for a queue member.
- Show the time when started the last pause for queue member on CLI for command 'queue show'.

SMS

- Added the 'n' option, which prevents the SMS from being written to the log file. This is needed for those countries with privacy laws that require providers to not log SMS content.

Channel Drivers

chan_dahdi

- The CALLERID(ani2) value for incoming calls is now populated in feat_dmf signaling mode. The information was previously discarded.
- Added the force_restart_unavailable_chans compatibility option. When enabled it causes Asterisk to restart the ISDN B channel if an outgoing call receives cause 44 (Requested channel not available).

chan_iax2

- The iax.conf forcejitterbuffer option has been removed. It is now always forced if you set iax.conf jitterbuffer=yes. If you put a jitter buffer on a channel it will be on the channel.
- A new configuration parameters, calltokenexpiration, has been added that controls the duration before a call token expires. Default duration is 10 seconds. Setting this to a higher value may help in lagged networks or those experiencing high packet loss.

chan_rtp (was chan_multicast_rtp)

- Added unicast RTP support and renamed chan_multicast_rtp to chan_rtp. The format for dialing a unicast RTP channel is:

  UnicastRTP/<destination-addr>[/[/options]]

  - Where <destination-addr> is something like 127.0.0.1:5060
  - Where <options> are in standard Asterisk flag options format:

    - c(<codec>) - Specify which codec/format to use such as 'ulaw'.
    - e(<engine>) - Specify which RTP engine to use such as 'asterisk'.

- New options were added for a multicast RTP channel. The format for dialing a multicast RTP channel is:

  MulticastRTP/<type>/<destination-addr>[/[/control-addr]][/[/options]]

  - Where <type> can be either 'basic' or 'linksys'.
  - Where <destination-addr> is something like '224.0.0.3:5060'.
  - Where <control-addr> is something like '127.0.0.1:5060'.
  - Where <options> are in standard Asterisk flag options format:

    - c(<codec>) - Specify which codec/format to use such as 'ulaw'.
    - i(<address>) - Specify the interface address from which multicast RTP is sent.
    - l(<enable>) - Set whether packets are looped back to the sender. The enable value can be 0 to set looping to off and non-zero to set looping on.
    - t(<ttl>) - Set the time-to-live (TTL) value for multicast packets.

chan_sip

- New rtpbindaddr global setting. This allows a user to define which ip address to bind the rtpengine to. For example, chan_sip might bind to eth0 (10.0.0.2) but rtpengine to eth1 (192.168.1.10).
- DTLS related configuration options can now be set at a general level. Enabling DTLS support, though, requires enabling it at the user or peer level.
- Added the possibility to set the From: header through the the SIP dial string (populating the fromuser/fromdomain fields), complementing the [!dnid] option for the To: header that has existed since 1.6.0 (1d6b192).

  NOTE: This is again separated by an exclamation mark, so the To: header may not contain one of those.
chan_pjsip

- New user_eq_phone endpoint setting. This adds a user-phone parameter to the request URI and From URI if the user is determined to be a phone number.
- New moh_passthrough endpoint setting. This will pass hold and unhold requests through using SIP re-invites with sendonly and sendrecv accordingly.
- Added the pjsip.conf system type disable_tcp_switch option. The option allows the user to disable switching from UDP to TCP transports described by RFC 3261 section 18.1.1.

Core

- The core of Asterisk uses a message bus called “Stasis” to distribute information to internal components. For performance reasons, the message distribution was modified to make use of a thread pool instead of a dedicated thread per consumer in certain cases. The initial settings for the thread pool can now be configured in 'stasis.conf'.
- A new core DNS API has been implemented which provides a common interface for DNS functionality. Modules that use this functionality will require that a DNS resolver module is loaded and available.
- Modified processing of command-line options to first parse only what is necessary to read asterisk.conf. Once asterisk.conf is fully loaded, the remaining options are processed. The -X option now applies to asterisk.conf only. To enable #exec for other config files you must set execincludes=yes in asterisk.conf. Any other option set on the command-line will now override the equivalent setting from asterisk.conf.
- The TLS core in Asterisk now supports X.509 certificate subject alternative names. This way one X.509 certificate can be used for hosts that can be reached under multiple DNS names or for multiple hosts.
- The Asterisk logging system now supports JSON structured logging. Log channels specified in logger.conf or added dynamically via CLI commands now support an optional specifier prior to their levels that determines their formatting. To set a log channel to format its entries as JSON, a formatter of [json] can be set, e.g., full => [json]debug,verbose,notice,warning,error
- The core now supports a ‘media cache’, which stores temporary media files retrieved from external sources. CLI commands have been added to manipulate and display the cached files, including:
  - media cache show <all> - show all cached media files, or details about one particular cached media file
  - media cache refresh <item> - force a refresh of a particular media file in the cache
  - media cache delete <item> - remove an item from the cache
  - media cache create <uri> - retrieve a URI and store it in the cache
- The ability for hints to be automatically created as a result of device state changes now exists in the PBX. This functionality is referred to as autohints and is configurable in extensions.conf by placing autohints=yes in the context. If enabled then a hint will be automatically created with the name of the device.

Functions

- The func_odbc global option single_db_connection default value has been changed to no.

Formats

- New module format_ogg_speex added which supports Speex codec inside Ogg containers (filename extension .spx).

CHANNEL

- Added CHANNEL(onhold) item that returns 1 (onhold) and 0 (not-onhold) for the hold status of a channel.

CURL

- The CURL function now supports a write option, which will save the retrieved file to a location on disk. As an example: 
  
  ```
  {{same => n,Set(CURL(https://1.1.1.1/foo.wav)="/tmp/foo.wav")}}
  ``
  
  will save 'foo.wav' to /tmp.

DTMF Features

- The transferdialattempts default value has been changed from 1 to 3.
- The transferinvalidsounnd has been changed from pbx-invalid to privacy-incorrect. These were changed to make DTMF transfers be more user-friendly by default.
Resources

res_http_media_cache

- A backend for the core media cache, this module retrieves media files from a remote HTTP(S) server and stores them in the core media cache for later playback.

res_musicionhold

- Added sort-randstart to the sort options. It sorts the files by name and then chooses the first file to play at random.
- Added preferchannelclass=no option to prefer the application-passed class over the channel-set musicclass. This allows separate hold-music from application (e.g. Queue or Dial) specified music.

res_resolver_unbound

- Added a res_resolver_unbound module which uses the libunbound resolver library to perform DNS resolution. This module requires the libunbound library to be installed in order to be used.

res_pjsip

- A new SIP resolver using the core DNS API has been implemented. This relies on external SIP resolver support in PJSIP which is only available as of PJSIP 2.4. If this support is unavailable the existing built-in PJSIP SIP resolver will be used instead. The new SIP resolver provides NAPTR support, improved SRV support, and AAAA record support.

res_pjsip_info_empty

- A new module that can respond to empty Content-Type INFO packets during call. Some SBCs will terminate a call if their empty INFO packets are not responded to within a predefined time.

res_pjsip_outbound_registration

- A new fatal_retry_interval option has been added to outbound registration. When set (default is zero), and upon receiving a failure response to an outbound registration, registration is retried at the given interval up to max_retries.

res_pjsip_outbound_publish

- Added a new multi_user option that when set to yes allows a given configuration to be used for multiple users.

CEL Backends

cel_pgsqql

- Added a new option, usegmtime, which causes timestamps in CEL events to be logged in GMT.
- Added support to set schema where located the table cel. This settings is configurable for cel_pgsqql via the ‘schema’ in configuration file cel_pgsqql.conf.

CDR Backends

cdr_adaptive_odbc

- Added the ability to set the character to quote identifiers. This allows adding the character at the start and end of table and column names. This setting is configurable for cdr_adaptive_odbc via the quoted_identifiers in configuration file cdr_adaptive_odbc.conf.
cdr_odbc

- Added a new configuration option, `newcdrcolumns`, which enables use of the post-1.8 CDR columns `peeraccount`, `linkedid`, and `sequence`.

cdr_csv

- Added a new configuration option, `newcdrcolumns`, which enables use of the post-1.8 CDR columns `peeraccount`, `linkedid`, and `sequence`. 
Upgrading to Asterisk 14

Overview

As Asterisk 14 is built on the architecture introduced in Asterisk 12 and continued in Asterisk 13, users upgrading to Asterisk 14 from an older version of Asterisk should be aware of the architectural changes that were made in the previous Standard release. It is recommended that you review:

- The upgrade notes on this page
- The New in 14 information, which lists the major new features in Asterisk 14
- The notes on Upgrading to Asterisk 13 if you are upgrading from a version of Asterisk prior to Asterisk 13
- The notes on what is New in 13 if you are upgrading from a version of Asterisk prior to Asterisk 13.

ARI

- The policy for when to send Dial events has changed. Previously, Dial events were sent on the calling channel's topic. However, starting in Asterisk 14, if there is no calling channel on which to send the event, the event is instead sent on the called channel's topic. Note that for the ARI channels resource's dial operation, this means that the Dial events will always be sent on the called channel's topic.

Channel Drivers

can_dahdi

- For users using the FXO port (FXS signaling) distinctive ring detection feature, you will need to adjust the dringX count values. The count values now only record ring end events instead of any DAHDI event. A ring-ring-ring pattern would exceed the pattern limits and stop Caller-ID detection.

can_sip

- The SIP dial string has been extended past the [!dnid] option by another exclamation mark: [!dnid][!fromuri]. An exclamation mark in the To-URI will now mean changes to the From-URI.

Core

- The REF_DEBUG compiler flag is now used to enable refdebug by default. The setting can be overridden in asterisk.conf by setting refdebug in the options category. No recompile is required to enable/disable it.
- Modified processing of command-line options to first parse only what is necessary to read asterisk.conf. Once asterisk.conf is fully loaded, the remaining options are processed. The -X option now applies to asterisk.conf only. To enable #exec for other config files you must set execincludes=yes in asterisk.conf. Any other option set on the command-line will now override the equivalent setting from asterisk.conf.

AMI

- The ModuleCheck Action's Version key will no longer show the moduleversion. The value will always be blank.
- The Command action now sends the output from the CLI command as a series of Output headers for each line instead of as a block of text with the --END COMMAND-- delimiter to match the output from other actions.
- Commands that fail to execute (no such command, invalid syntax etc.) now return an Error response instead of Success.

CLI

- The core show file version command has been removed. When Asterisk moved to Git, the source control version support was removed. As a result, the CLI command was no longer useful and was removed as well.

Logging

- The first callid created is now 1 instead of 0. The value 0 is now reserved to represent a lack of callid.

app_amd
The `maximum_number_of_words` configuration option and parameter to the AMD application previously did not match the documented functionality + variable name. In Asterisk 13, a value of ‘3’ would mean that if ‘3’ words were detected, the result would be detection as a ‘MACHINE’. As of this version, the value reflects the maximum words that if EXCEEDED (rather than reached), would result in detection as a machine. This means that you should update this value to be one higher than your previous value, if your previous value was working well for you.
Asterisk 14 AGI Commands
Asterisk 14 AGICommand_answer

ANSWER

Synopsis
Answer channel

Description
Answers channel if not already in answer state. Returns -1 on channel failure, or 0 if successful.

Syntax

```
ANSWER
```

Arguments

See Also

- Asterisk 14 AGICommand_hangup

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_asyncagi break

ASYNCAGI BREAK

Synopsis
Interrupts Async AGI

Description
Interrupts expected flow of Async AGI commands and returns control to previous source (typically, the PBX dialplan).

Syntax

```
ASYNCAGI BREAK
```

Arguments

See Also
- Asterisk 14 AGICommand_hangup

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_channel status

CHANNEL STATUS

Synopsis

Returns status of the connected channel.

Description

Returns the status of the specified channelname. If no channel name is given then returns the status of the current channel.

Return values:

- 0 - Channel is down and available.
- 1 - Channel is down, but reserved.
- 2 - Channel is off hook.
- 3 - Digits (or equivalent) have been dialed.
- 4 - Line is ringing.
- 5 - Remote end is ringing.
- 6 - Line is up.
- 7 - Line is busy.

Syntax

```
CHANNEL STATUS CHANNELNAME
```

Arguments

- channelname

**Asterisk 14 AGICommand_control stream file**

**CONTROL STREAM FILE**

**Synopsis**

Sends audio file on channel and allows the listener to control the stream.

**Description**

Send the given file, allowing playback to be controlled by the given digits, if any. Use double quotes for the digits if you wish none to be permitted. If offsetms is provided then the audio will seek to offsetms before play starts. Returns 0 if playback completes without a digit being pressed, or the ASCII numerical value of the digit if one was pressed, or -1 on error or if the channel was disconnected. Returns the position where playback was terminated as endpos.

It sets the following channel variables upon completion:

- **CPLAYBACKSTATUS** - Contains the status of the attempt as a text string
  - SUCCESS
  - USERSTOPPED
  - REMOTESTOPPED
  - ERROR
- **CPLAYBACKOFFSET** - Contains the offset in ms into the file where playback was at when it stopped. -1 is end of file.
- **CPLAYBACKSTOPKEY** - If the playback is stopped by the user this variable contains the key that was pressed.

**Syntax**

```
CONTROL STREAM FILE FILENAME ESCAPE_DIGITS SKIPMS FFCHAR REMCHR PAUSECHR OFFSETMS
```

**Arguments**

- **filename** - The file extension must not be included in the filename.
- **escape_digits**
- **skipms**
- **ffchar** - Defaults to #
- **rewchr** - Defaults to *
- **pausechr**
- **offsetms** - Offset, in milliseconds, to start the audio playback

Asterisk 14 AGICommand_database del

DATABASE DEL

Synopsis
Removes database key/value

Description
Deletes an entry in the Asterisk database for a given family and key.
Returns 1 if successful, 0 otherwise.

Syntax

```
DATABASE DEL FAMILY KEY
```

Arguments

- family
- key

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_database deltree

DATABASE DELTREE

Synopsis

Removes database keytree/value

Description

Deletes a family or specific keytree within a family in the Asterisk database.

Returns 1 if successful, 0 otherwise.

Syntax

```
DATABASE DELTREE FAMILY KEYTREE
```

Arguments

- family
- keytree

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164.
**Asterisk 14 AGICommand_database get**

**DATABASE GET**

**Synopsis**

Gets database value

**Description**

Retrieves an entry in the Asterisk database for a given *family* and *key*.

Returns 0 if *key* is not set. Returns 1 if *key* is set and returns the variable in parenthesis.

Example return code: 200 result=1 (testvariable)

**Syntax**

```
DATABASE GET FAMILY KEY
```

**Arguments**

- family
- key

**See Also**

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_database put

DATABASE PUT

Synopsis

Adds/updates database value

Description

Adds or updates an entry in the Asterisk database for a given family, key, and value.

Returns 1 if successful, 0 otherwise.

Syntax

```
DATABASE PUT FAMILY KEY VALUE
```

Arguments

- family
- key
- value

Asterisk 14 AGICommand_exec

EXEC

Synopsis
Executes a given Application

Description
Executes application with given options.
Returns whatever the application returns, or -2 on failure to find application.

Syntax

```plaintext
EXEC APPLICATION OPTIONS
```

Arguments

- application
- options

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_get data

GET DATA

Synopsis
Prompts for DTMF on a channel

Description
Stream the given file, and receive DTMF data.
Returns the digits received from the channel at the other end.

Syntax

```
GET DATA FILE TIMEOUT MAXDIGITS
```

Arguments
- `file`
- `timeout`
- `maxdigits`

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_get full variable

GET FULL VARIABLE

Synopsis

Evaluates a channel expression

Description

Returns 0 if \texttt{variablename} is not set or channel does not exist. Returns 1 if \texttt{variablename} is set and returns the variable in parenthesis. Understands complex variable names and builtin variables, unlike GET VARIABLE.

Example return code: 200 result=1 (testvariable)

Syntax

\begin{verbatim}
GET FULL VARIABLE VARIABLENNAME CHANNEL NAME
\end{verbatim}

Arguments

\begin{itemize}
  \item \texttt{variablename}
  \item \texttt{channel name}
\end{itemize}

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_get option

GET OPTION

Synopsis
Stream file, prompt for DTMF, with timeout.

Description
Behaves similar to STREAM FILE but used with a timeout option.

Syntax
GET OPTION FILENAME ESCAPE_DIGITS TIMEOUT

Arguments
- filename
- escape_digits
- timeout

See Also
- Asterisk 14 AGICommand_stream file

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_get_variable

GET VARIABLE

Synopsis
Gets a channel variable.

Description
Returns 0 if variablename is not set. Returns 1 if variablename is set and returns the variable in parentheses.
Example return code: 200 result=1 (testvariable)

Syntax
GET VARIABLE VARIABLENAME

Arguments
• variablename

Asterisk 14 AGICommand_gosub

GOSUB

Synopsis

Cause the channel to execute the specified dialplan subroutine.

Description

Cause the channel to execute the specified dialplan subroutine, returning to the dialplan with execution of a Return().

Syntax

```
GOSUB CONTEXT EXTENSION PRIORITY OPTIONAL-ARGUMENT
```

Arguments

- context
- extension
- priority
- optional-argument

See Also

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_hangup

HANGUP

Synopsis
Hangup a channel.

Description
Hangs up the specified channel. If no channel name is given, hangs up the current channel

Syntax

| HANGUP CHANNELNAME |

Arguments
- channelname

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_noop

NOOP

Synopsis
Does nothing.

Description
Does nothing.

Syntax

```
NOOP
```

Arguments

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_receive char

RECEIVE CHAR

Synopsis

Receives one character from channels supporting it.

Description

Receives a character of text on a channel. Most channels do not support the reception of text. Returns the decimal value of the character if one is received, or 0 if the channel does not support text reception. Returns –1 only on error/hangup.

Syntax

```
RECEIVE CHAR TIMEOUT
```

Arguments

- `timeout` - The maximum time to wait for input in milliseconds, or 0 for infinite. Most channels do not support the reception of text.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_receive text

RECEIVE TEXT

Synopsis

Receives text from channels supporting it.

Description

Receives a string of text on a channel. Most channels do not support the reception of text. Returns \(-1\) for failure or \(1\) for success, and the string in parenthesis.

Syntax

```
RECEIVE TEXT TIMEOUT
```

Arguments

- \texttt{timeout} - The timeout to be the maximum time to wait for input in milliseconds, or \(0\) for infinite.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_record file

RECORD FILE

Synopsis

Records to a given file.

Description

Record to a file until a given dtmf digit in the sequence is received. Returns -1 on hangup or error. The format will specify what kind of file will be recorded. The timeout is the maximum record time in milliseconds, or -1 for no timeout. offset samples is optional, and, if provided, will seek to the offset without exceeding the end of the file. silence is the number of seconds of silence allowed before the function returns despite the lack of dtmf digits or reaching timeout. silence value must be preceded by s= and is also optional.

Syntax

```
RECORD FILE FILENAME FORMAT ESCAPE_DIGITS TIMEOUT OFFSET SAMPLES BEEP S=SILENCE
```

Arguments

- filename
- format
- escape_digits
- timeout
- offset samples
- BEEP
- s=silence

Asterisk 14 AGICommand_say alpha

SAY ALPHA

Synopsis

Says a given character string.

Description

Say a given character string, returning early if any of the given DTMF digits are received on the channel. Returns 0 if playback completes without a digit being pressed, or the ASCII numerical value of the digit if one was pressed or -1 on error/hangup.

Syntax

```
SAY ALPHA NUMBER ESCAPE_DIGITS
```

Arguments

- `number`
- `escape_digits`

See Also

Import Version

Asterisk 14 AGICommand_say date

SAY DATE

Synopsis
Says a given date.

Description
Say a given date, returning early if any of the given DTMF digits are received on the channel. Returns 0 if playback completes without a digit being pressed, or the ASCII numerical value of the digit if one was pressed or -1 on error/hangup.

Syntax

```
SAY DATE DATE ESCAPE_DIGITS
```

Arguments

- `date` - Is number of seconds elapsed since 00:00:00 on January 1, 1970. Coordinated Universal Time (UTC).
- `escape_digits` -

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_say_datetime

SAY DATETIME

Synopsis

Says a given time as specified by the format given.

Description

Say a given time, returning early if any of the given DTMF digits are received on the channel. Returns 0 if playback completes without a digit being pressed, or the ASCII numerical value of the digit if one was pressed or -1 on error/hangup.

Syntax

```
SAY DATETIME TIME ESCAPE_DIGITS FORMAT TIMEZONE
```

Arguments

- **time** - Is number of seconds elapsed since 00:00:00 on January 1, 1970, Coordinated Universal Time (UTC)
- **escape_digits**
- **format** - ls the format the time should be said in. See voicemail.conf (defaults to ABdY 'digits/at' IMp).
- **timezone** - Acceptable values can be found in /usr/share/zoneinfo Defaults to machine default.

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_send text

SEND TEXT

Synopsis

Sends text to channels supporting it.

Description

Sends the given text on a channel. Most channels do not support the transmission of text. Returns 0 if text is sent, or if the channel does not support text transmission. Returns -1 only on error/hangup.

Syntax

SEND TEXT TEXT TO SEND

Arguments

- text to send - Text consisting of greater than one word should be placed in quotes since the command only accepts a single argument.

Asterisk 14 AGICommand_set autohangup

SET AUTOHANGUP

Synopsis

Autohangup channel in some time.

Description

Cause the channel to automatically hangup at time seconds in the future. Of course it can be hungup before then as well. Setting to 0 will cause the autohangup feature to be disabled on this channel.

Syntax

```
SET AUTOHANGUP TIME
```

Arguments

- time

Asterisk 14 AGICommand_set callerid

**SET CALLERID**

**Synopsis**

Sets callerid for the current channel.

**Description**

Changes the callerid of the current channel.

**Syntax**

```
SET CALLERID NUMBER
```

**Arguments**

- `number`

**See Also**

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_set context

SET CONTEXT

Synopsis
Sets channel context.

Description
Sets the context for continuation upon exiting the application.

Syntax

```
SET CONTEXT DESIRED CONTEXT
```

Arguments

- desired context

See Also

Import Version

Asterisk 14 AGICommand_set extension

SET EXTENSION

Synopsis
Changes channel extension.

Description
Changes the extension for continuation upon exiting the application.

Syntax

```
SET EXTENSION NEW EXTENSION
```

Arguments

- new extension

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_set music

SET MUSIC

Synopsis
Enable/Disable Music on hold generator

Description
Enables/Disables the music on hold generator. If class is not specified, then the default music on hold class will be used. This generator will be stopped automatically when playing a file.
Always returns 0.

Syntax

```
SET MUSIC  CLASS
```

Arguments

- {{}}
  - {{}}
    - on
  - {{}}
    - off
  - class

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_set priority

SET PRIORITY

Synopsis
Set channel dialplan priority.

Description
Changes the priority for continuation upon exiting the application. The priority must be a valid priority or label.

Syntax
```
SET PRIORITY PRIORITY
```

Arguments
- `priority`

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_set variable

SET VARIABLE

Synopsis
Sets a channel variable.

Description
Sets a variable to the current channel.

Syntax

```
SET VARIABLE VARIABLENAME VALUE
```

Arguments

- `variablename`
- `value`

See Also

Import Version

Asterisk 14 AGICommand_speech activate grammar

**SPEECH ACTIVATE GRAMMAR**

**Synopsis**
Activates a grammar.

**Description**
Activates the specified grammar on the speech object.

**Syntax**

```
SPEECH ACTIVATE GRAMMAR GRAMMAR NAME
```

**Arguments**
- `grammar name`

**See Also**

**Import Version**
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech create

SPEECH CREATE

Synopsis
Creates a speech object.

Description
Create a speech object to be used by the other Speech AGI commands.

Syntax

```
SPEECH CREATE ENGINE
```

Arguments

- `engine`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech deactivate grammar

SPEECH DEACTIVATE GRAMMAR

Synopsis
Deactivates a grammar.

Description
Deactivates the specified grammar on the speech object.

Syntax

```
SPEECH DEACTIVATE GRAMMAR GRAMMAR NAME
```

Arguments
- grammar name

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech destroy

SPEECH DESTROY

Synopsis
Destroys a speech object.

Description
Destroy the speech object created by SPEECH CREATE.

Syntax

```
SPEECH DESTROY
```

Arguments

See Also

- Asterisk 14 AGICommand_speech create

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech load grammar

SPEECH LOAD GRAMMAR

Synopsis
Loads a grammar.

Description
Loads the specified grammar as the specified name.

Syntax

SPEECH LOAD GRAMMAR GRAMMAR NAME PATH TO GRAMMAR

Arguments

- grammar name
- path to grammar

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech recognize

SPEECH RECOGNIZE

Synopsis
Recognizes speech.

Description
Plays back given prompt while listening for speech and dtmf.

Syntax

SPEECH RECOGNIZE PROMPT TIMEOUT OFFSET

Arguments

- prompt
- timeout
- offset

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech set

SPEECH SET

Synopsis
Sets a speech engine setting.

Description
Set an engine-specific setting.

Syntax

```
SPEECH SET NAME VALUE
```

Arguments

- **name**
- **value**

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_speech unload grammar

SPEECH UNLOAD GRAMMAR

Synopsis
Unloads a grammar.

Description
Unloads the specified grammar.

Syntax

```plaintext
SPEECH UNLOAD GRAMMAR GRAMMAR NAME
```

Arguments

- `grammar name`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_stream file

STREAM FILE

Synopsis

Sends audio file on channel.

Description

Send the given file, allowing playback to be interrupted by the given digits, if any. Returns 0 if playback completes without a digit being pressed, or the ASCII numerical value of the digit if one was pressed, or -1 on error or if the channel was disconnected. If musiconhold is playing before calling stream file it will be automatically stopped and will not be restarted after completion.

It sets the following channel variables upon completion:

- PLAYBACKSTATUS - The status of the playback attempt as a text string.
  - SUCCESS
  - FAILED

Syntax

STREAM FILE FILENAME ESCAPE_DIGITS SAMPLE OFFSET

Arguments

- filename - File name to play. The file extension must not be included in the filename.
- escape_digits - Use double quotes for the digits if you wish none to be permitted.
- sample offset - If sample offset is provided then the audio will seek to sample offset before play starts.

See Also

- Asterisk 14 AGICommand_control stream file

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_tdd mode

TDD MODE

Synopsis
Toggles TDD mode (for the deaf).

Description
Enable/Disable TDD transmission/reception on a channel. Returns 1 if successful, or 0 if channel is not TDD-capable.

Syntax

```
TDD MODE BOOLEAN
```

Arguments

- boolean
  - on
  - off

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_verbose

VERBOSE

Synopsis
Logs a message to the asterisk verbose log.

Description
Sends message to the console via verbose message system. level is the verbose level (1-4). Always returns 1.

Syntax

```
VERBOSE MESSAGE LEVEL
```

Arguments

- message
- level

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 AGICommand_wait for digit

WAIT FOR DIGIT

Synopsis

Waits for a digit to be pressed.

Description

Waits up to timeout milliseconds for channel to receive a DTMF digit. Returns -1 on channel failure, 0 if no digit is received in the timeout, or the numerical value of the ascii of the digit if one is received. Use -1 for the timeout value if you desire the call to block indefinitely.

Syntax

```
WAIT FOR DIGIT TIMEOUT
```

Arguments

- timeout

Asterisk 14 ManagerAction_AbsoluteTimeout

AbsoluteTimeout

Synopsis
Set absolute timeout.

Description
Hangup a channel after a certain time. Acknowledges set time with Timeout Set message.

Syntax

```
Action: AbsoluteTimeout
ActionID: <value>
Channel: <value>
Timeout: <value>
```

Arguments
- ActionID - ActionID for this transaction. Will be returned.
- Channel - Channel name to hangup.
- Timeout - Maximum duration of the call (sec).

Asterisk 14 ManagerAction_AgentLogoff

AgentLogoff

Synopsis
Sets an agent as no longer logged in.

Description
Sets an agent as no longer logged in.

Syntax

```
Action: AgentLogoff
ActionID: <value>
Agent: <value>
Soft: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Agent** - Agent ID of the agent to log off.
- **Soft** - Set to true to not hangup existing calls.

Asterisk 14 ManagerAction_AGI

AGI

Synopsis

Add an AGI command to execute by Async AGI.

Description

Add an AGI command to the execute queue of the channel in Async AGI.

Syntax

```
Action: AGI
ActionID: <value>
Channel: <value>
Command: <value>
CommandID: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Channel that is currently in Async AGI.
- **Command** - Application to execute.
- **CommandID** - This will be sent back in CommandID header of AsyncAGI exec event notification.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
**Asterisk 14 Manager**Action_AOCMessage

**AOCMessage**

**Synopsis**

Generate an Advice of Charge message on a channel.

**Description**

Generates an AOC-D or AOC-E message on a channel.

**Syntax**

```
Action: AOCMessage
ActionID: <value>
Channel: <value>
ChannelPrefix: <value>
MsgType: <value>
ChargeType: <value>
UnitAmount(0): <value>
UnitType(0): <value>
CurrencyName: <value>
CurrencyAmount: <value>
CurrencyMultiplier: <value>
TotalType: <value>
AOCBillingId: <value>
ChargingAssociationId: <value>
ChargingAssociationNumber: <value>
ChargingAssociationPlan: <value>
```

**Arguments**

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Channel name to generate the AOC message on.
- **ChannelPrefix** - Partial channel prefix. By using this option one can match the beginning part of a channel name without having to put the entire name in. For example if a channel name is SIP/snom-00000001 and this value is set to SIP/snom, then that channel matches and the message will be sent. Note however that only the first matched channel has the message sent on it.
- **MsgType** - Defines what type of AOC message to create, AOC-D or AOC-E
  - D
  - E
- **ChargeType** - Defines what kind of charge this message represents.
  - NA
  - FREE
  - Currency
  - Unit
- **UnitAmount(0)** - This represents the amount of units charged. The ETSI AOC standard specifies that this value along with the optional UnitType value are entries in a list. To accommodate this these values take an index value starting at 0 which can be used to generate this list of unit entries. For example, if two unit entries were required this could be achieved by setting the parameter UnitAmount(0)=1234 and UnitAmount(1)=5678. Note that UnitAmount at index 0 is required when ChargeType=Unit, all other entries in the list are optional.
- **UnitType(0)** - Defines the type of unit. ETSI AOC standard specifies this as an integer value between 1 and 16, but this value is left open to accept any positive integer. Like the UnitAmount parameter, this value represents a list entry and has an index parameter that starts at 0.
- **CurrencyName** - Specifies the currency's name. Note that this value is truncated after 10 characters.
- **CurrencyAmount** - Specifies the charge unit amount as a positive integer. This value is required when ChargeType==Currency.
- **CurrencyMultiplier** - Specifies the currency multiplier. This value is required when ChargeType==Currency.
  - OneThousandth
  - OneHundredth
  - OneTenth
  - One
  - Ten
  - Hundred
  - Thousand
- **TotalType** - Defines what kind of AOC-D total is represented.
  - Total
  - SubTotal
- **AOCBillingId** - Represents a billing ID associated with an AOC-D or AOC-E message. Note that only the first 3 items of the enum are valid AOC-D billing IDs
  - Normal
  - ReverseCharge
  - CreditCard
• CallFwdUnconditional
• CallFwdBusy
• CallFwdNoReply
• CallDeflection
• CallTransfer

- **ChargingAssociationId** - Charging association identifier. This is optional for AOC-E and can be set to any value between -32768 and 32767
- **ChargingAssociationNumber** - Represents the charging association party number. This value is optional for AOC-E.
- **ChargingAssociationPlan** - Integer representing the charging plan associated with the ChargingAssociationNumber. The value is bits 7 through 1 of the Q.931 octet containing the type-of-number and numbering-plan-identification fields.

Asterisk 14 Manager Action_Attxfer

Atxfer

Synopsis
Attended transfer.

Description
Attended transfer.

Syntax

```plaintext
Action: Attxfer
ActionID: <value>
Channel: <value>
Exten: <value>
Context: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Transferer's channel.
- **Exten** - Extension to transfer to.
- **Context** - Context to transfer to.

Asterisk 14 Manager Action_ControlPlayback

ControlPlayback

Synopsis

Control the playback of a file being played to a channel.

Description

Control the operation of a media file being played back to a channel. Note that this AMI action does not initiate playback of media to channel, but rather controls the operation of a media operation that was already initiated on the channel.

Note

The pause and restart Control options will stop a playback operation if that operation was not initiated from the ControlPlayback application or the control stream file AGI command.

Syntax

Action: ControlPlayback
ActionID: <value>
Channel: <value>
Control: <value>

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - The name of the channel that currently has a file being played back to it.
- **Control**
  - **stop** - Stop the playback operation.
  - **forward** - Move the current position in the media forward. The amount of time that the stream moves forward is determined by the skipms value passed to the application that initiated the playback.
  - **reverse** - Move the current position in the media backward. The amount of time that the stream moves backward is determined by the skipms value passed to the application that initiated the playback.
  - **pause** - Pause/unpause the playback operation, if supported. If not supported, stop the playback.
  - **restart** - Restart the playback operation, if supported. If not supported, stop the playback.

Action_CoreShowChannels

CoreShowChannels

Synopsis
List currently active channels.

Description
List currently defined channels and some information about them.

Syntax

```
Action: CoreShowChannels
ActionID: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 ManagerAction_CoreStatus

CoreStatus

Synopsis
Show PBX core status variables.

Description
Query for Core PBX status.

Syntax

```
Action: CoreStatus
ActionID: <value>
```

Arguments

- `ActionID` - ActionID for this transaction. Will be returned.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
CreateConfig

Synopsis

Creates an empty file in the configuration directory.

Description

This action will create an empty file in the configuration directory. This action is intended to be used before an UpdateConfig action.

Syntax

```
Action: CreateConfig
ActionID: <value>
Filename: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Filename** - The configuration filename to create (e.g. foo.conf).

Action_DAHDIDNDoff

DAHDI Off

Synopsis

Toggle DAHDI channel Do Not Disturb status OFF.

Description

Equivalent to the CLI command "dahdi set dnd channel off".

Syntax

```
Action: DAHDI Off
ActionID: <value>
DAHDI Channel: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **DAHDI Channel** - DAHDI channel number to set DND off.

Action_DialplanExtensionAdd

DialplanExtensionAdd

Synopsis
Add an extension to the dialplan

Description

Syntax

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>ActionID for this transaction. Will be returned.</td>
</tr>
<tr>
<td>Context</td>
<td>Context where the extension will be created. The context will be created if it does not already exist.</td>
</tr>
<tr>
<td>Extension</td>
<td>Name of the extension that will be created (may include callerid match by separating with '/')</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority being added to this extension. Must be either hint or a numerical value.</td>
</tr>
<tr>
<td>Application</td>
<td>The application to use for this extension at the requested priority</td>
</tr>
<tr>
<td>ApplicationData</td>
<td>Arguments to the application.</td>
</tr>
<tr>
<td>Replace</td>
<td>If set to 'yes', '1', 'true' or any of the other values we evaluate as true, then if an extension already exists at the requested context, extension, and priority it will be overwritten. Otherwise, the existing extension will remain and the action will fail.</td>
</tr>

Asterisk 14 ManagerAction_ExtensionState

ExtensionState

Synopsis
Check Extension Status.

Description
Report the extension state for given extension. If the extension has a hint, will use devicestate to check the status of the device connected to the extension. Will return an Extension Status message. The response will include the hint for the extension and the status.

Syntax

```
Action: ExtensionState
ActionID: <value>
Exten: <value>
Context: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Exten** - Extension to check state on.
- **Context** - Context for extension.

Asterisk 14 ManagerAction_FAXSession

FAXSession

Synopsis
Responds with a detailed description of a single FAX session

Description
Provides details about a specific FAX session. The response will include a common subset of the output from the CLI command 'fax show session <session_number>' for each technology. If the FAX technology used by this session does not include a handler for FAXSession, then this action will fail.

Syntax

```plaintext
Action: FAXSession
ActionID: <value>
SessionNumber: <value>
```

Arguments
- **ActionID** - ActionID for this transaction. Will be returned.
- **SessionNumber** - The session ID of the fax the user is interested in.

**Action_FAXSessions**

**FAXSessions**

**Synopsis**

Lists active FAX sessions

**Description**

Will generate a series of FAXSession events with information about each FAXSession. Closes with a FAXSessionsComplete event which includes a count of the included FAX sessions. This action works in the same manner as the CLI command 'fax show sessions'

**Syntax**

```
Action: FAXSessions
ActionID: <value>
```

**Arguments**

- **ActionID** - ActionID for this transaction. Will be returned.

**See Also**

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Manager Action_FAXStats

FAXStats

Synopsis

Responds with fax statistics

Description

Provides FAX statistics including the number of active sessions, reserved sessions, completed sessions, failed sessions, and the number of receive/transmit attempts. This command provides all of the non-technology specific information provided by the CLI command 'fax show stats'

Syntax

```
Action: FAXStats
ActionID: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Manager

Action_Filter

Filter

Synopsis

Dynamically add filters for the current manager session.

Description

The filters added are only used for the current session. Once the connection is closed the filters are removed.

This command requires the system permission because this command can be used to create filters that may bypass filters defined in manager.conf

Syntax

```
Action: Filter
ActionID: <value>
Operation: <value>
Filter: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Operation**
  - Add - Add a filter.
- **Filter** - Filters can be whitelist or blacklist
  - Example whitelist filter: "Event: Newchannel"
  - Example blacklist filter: "!Channel: DAHDI.*"

  This filter option is used to whitelist or blacklist events per user to be reported with regular expressions and are allowed if both the regex matches and the user has read access as defined in manager.conf. Filters are assumed to be for whitelisting unless preceded by an exclamation point, which marks it as being black. Evaluation of the filters is as follows:

  - If no filters are configured all events are reported as normal.
  - If there are white filters only: implied black all filter processed first, then white filters.
  - If there are black filters only: implied white all filter processed first, then black filters.
  - If there are both white and black filters: implied black all filter processed first, then white filters, and lastly black filters.

Asterisk 14 ManagerAction_GetConfig

GetConfig

Synopsis
Retrieve configuration.

Description
This action will dump the contents of a configuration file by category and contents or optionally by specified category only. In the case where a category name is non-unique, a filter may be specified to match only categories with matching variable values.

Syntax

```
Action: GetConfig
ActionID: <value>
Filename: <value>
Category: <value>
Filter: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Filename** - Configuration filename (e.g. foo.conf).
- **Category** - Category in configuration file.
- **Filter** - A comma separated list of `name_regex=value_regex` expressions which will cause only categories whose variables match all expressions to be considered. The special variable name `TEMPLATES` can be used to control whether templates are included. Passing `include` as the value will include templates along with normal categories. Passing `restrict` as the value will restrict the operation to `ONLY` templates. Not specifying a `TEMPLATES` expression results in the default behavior which is to not include templates.

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 ManagerAction_GetConfigJSON

GetConfigJSON

Synopsis

Retrieve configuration (JSON format).

Description

This action will dump the contents of a configuration file by category and contents in JSON format or optionally by specified category only. This only makes sense to be used using rawman over the HTTP interface. In the case where a category name is non-unique, a filter may be specified to match only categories with matching variable values.

Syntax

```
Action: GetConfigJSON
ActionID: <value>
Filename: <value>
Category: <value>
Filter: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Filename** - Configuration filename (e.g. foo.conf).
- **Category** - Category in configuration file.
- **Filter** - A comma separated list of `name_regex=value_regex` expressions which will cause only categories whose variables match all expressions to be considered. The special variable name `TEMPLATES` can be used to control whether templates are included. Passing `include` as the value will include templates along with normal categories. Passing `restrict` as the value will restrict the operation to ONLY templates. Not specifying a `TEMPLATES` expression results in the default behavior which is to not include templates.

Hangup

Synopsis
Hangup channel.

Description
Hang up a channel.

Syntax

```
Action: Hangup
ActionID: <value>
Channel: <value>
Cause: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - The exact channel name to be hung up, or to use a regular expression, set this parameter to: /regex/
  
  Example exact channel: SIP/provider-0000012a
  
  Example regular expression: /^SIP/provider-.*$/
- **Cause** - Numeric hangup cause.

Asterisk 14 ManagerAction_MessageSend

MessageSend

Synopsis
Send an out of call message to an endpoint.

Description

Syntax

```
Action: MessageSend
ActionID: <value>
To: <value>
From: <value>
Body: <value>
Base64Body: <value>
Variable: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **To** - The URI the message is to be sent to.
  - **Technology: PJSiP** Specifying a prefix of `pjsip:` will send the message as a SIP MESSAGE request.
  - **Technology: SIP** Specifying a prefix of `sip:` will send the message as a SIP MESSAGE request.
  - **Technology: XMPP** Specifying a prefix of `xmpp:` will send the message as an XMPP chat message.
- **From** - A From URI for the message if needed for the message technology being used to send this message.
  - **Technology: PJSiP** The `from` parameter can be a configured endpoint or in the form of "display-name" <URI>.
  - **Technology: SIP** The `from` parameter can be a configured peer name or in the form of "display-name" <URI>.
  - **Technology: XMPP** Specifying a prefix of `xmpp:` will specify the account defined in `xmpp.conf` to send the message from. Note that this field is required for XMPP messages.
- **Body** - The message body text. This must not contain any newlines as that conflicts with the AMI protocol.
- **Base64Body** - Text bodies requiring the use of newlines have to be `base64` encoded in this field. `Base64Body` will be decoded before being sent out. `Base64Body` takes precedence over `Body`.
- **Variable** - Message variable to set, multiple `Variable:` headers are allowed. The header value is a comma separated list of name=value pairs.

Action_MixMonitor

Synopsis

Record a call and mix the audio during the recording. Use of StopMixMonitor is required to guarantee the audio file is available for processing during dialplan execution.

Description

This action records the audio on the current channel to the specified file.

- **MIXMONITOR_FILENAME** - Will contain the filename used to record the mixed stream.

Syntax

```
Action: MixMonitor
ActionID: <value>
Channel: <value>
File: <value>
options: <value>
Command: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Used to specify the channel to record.
- **File** - Is the name of the file created in the monitor spool directory. Defaults to the same name as the channel (with slashes replaced with dashes). This argument is optional if you specify to record unidirectional audio with either the r(filename) or t(filename) options in the options field. If neither MIXMONITOR_FILENAME or this parameter is set, the mixed stream won't be recorded.
- **options** - Options that apply to the MixMonitor in the same way as they would apply if invoked from the MixMonitor application. For a list of available options, see the documentation for the mixmonitor application.
- **Command** - Will be executed when the recording is over. Any strings matching `^(X)` will be unescaped to $X$. All variables will be evaluated at the time MixMonitor is called.

Action_MixMonitorMute

MixMonitorMute

Synopsis

Mute / unMute a Mixmonitor recording.

Description

This action may be used to mute a MixMonitor recording.

Syntax

```
Action: MixMonitorMute
ActionID: <value>
Channel: <value>
Direction: <value>
State: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Used to specify the channel to mute.
- **Direction** - Which part of the recording to mute: read, write or both (from channel, to channel or both channels).
- **State** - Turn mute on or off: 1 to turn on, 0 to turn off.

ModuleCheck

Synopsis

Check if module is loaded.

Description

Checks if Asterisk module is loaded. Will return Success/Failure. For success returns, the module revision number is included.

Syntax

```
Action: ModuleCheck
ActionID: <value>
Module: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Module** - Asterisk module name (not including extension).

Asterisk 14 Manager Action_ModuleLoad

ModuleLoad

Synopsis
Module management.

Description
Loads, unloads or reloads an Asterisk module in a running system.

Syntax

```
Action: ModuleLoad
ActionID: <value>
Module: <value>
LoadType: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Module** - Asterisk module name (including .so extension) or subsystem identifier:
  - cdr
  - dnsmgr
  - extconfig
  - enum
  - acl
  - manager
  - http
  - logger
  - features
  - dsp
  - udptl
  - indications
  - cel
  - plc
- **LoadType** - The operation to be done on module. Subsystem identifiers may only be reloaded.
  - load
  - unload
  - reload
  
  If no module is specified for a reload loadtype, all modules are reloaded.

Asterisk 14 Manager Action_Monitor

Monitor

Synopsis

Monitor a channel.

Description

This action may be used to record the audio on a specified channel.

Syntax

```
Action: Monitor
ActionID: <value>
Channel: <value>
File: <value>
Format: <value>
Mix: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Used to specify the channel to record.
- **File** - Is the name of the file created in the monitor spool directory. Defaults to the same name as the channel (with slashes replaced with dashes).
- **Format** - Is the audio recording format. Defaults to `wav`.
- **Mix** - Boolean parameter as to whether to mix the input and output channels together after the recording is finished.

Asterisk 14 ManagerAction_MuteAudio

MuteAudio

Synopsis
Mute an audio stream.

Description
Mute an incoming or outgoing audio stream on a channel.

Syntax

```
Action: MuteAudio
ActionID: <value>
Channel: <value>
Direction: <value>
State: <value>
```

Arguments
- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - The channel you want to mute.
- **Direction**
  - `in` - Set muting on inbound audio stream. (to the PBX)
  - `out` - Set muting on outbound audio stream. (from the PBX)
  - `all` - Set muting on inbound and outbound audio streams.
- **State**
  - `on` - Turn muting on.
  - `off` - Turn muting off.

Synopsis

Update the mailbox message counts.

Description

Update the mailbox message counts.

Syntax

```
Action: MWIUpdate
ActionID: <value>
Mailbox: <value>
OldMessages: <value>
NewMessages: <value>
```

Arguments

- ActionID - ActionID for this transaction. Will be returned.
- Mailbox - Specific mailbox ID.
- OldMessages - The number of old messages in the mailbox. Defaults to zero if missing.
- NewMessages - The number of new messages in the mailbox. Defaults to zero if missing.

Asterisk 14 ManagerAction_Originate

Originate

Synopsis

Originate a call.

Description

Generates an outgoing call to a Extension/Context/Priority or Application/Data

Syntax

```
Action: Originate
ActionID: <value>
Channel: <value>
Exten: <value>
Context: <value>
Priority: <value>
Application: <value>
Data: <value>
Timeout: <value>
CallerID: <value>
Variable: <value>
Account: <value>
EarlyMedia: <value>
Async: <value>
Codecs: <value>
ChannelId: <value>
OtherChannelId: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Channel name to call.
- **Exten** - Extension to use (requires Context and Priority)
- **Context** - Context to use (requires Exten and Priority)
- **Priority** - Priority to use (requires Exten and Context)
- **Application** - Application to execute.
- **Data** - Data to use (requires Application).
- **Timeout** - How long to wait for call to be answered (in ms.).
- **CallerID** - Caller ID to be set on the outgoing channel.
- **Variable** - Channel variable to set, multiple Variable: headers are allowed.
- **Account** - Account code.
- **EarlyMedia** - Set to true to force call bridge on early media.
- **Async** - Set to true for fast origination.
- **Codecs** - Comma-separated list of codecs to use for this call.
- **ChannelId** - Channel Uniqueld to be set on the channel.
- **OtherChannelId** - Channel Uniqueld to be set on the second local channel.

Asterisk 14 ManagerAction_Park

Park

Synopsis
Park a channel.

Description
Park an arbitrary channel with optional arguments for specifying the parking lot used, how long the channel should remain parked, and what dial string to use as the parker if the call times out.

Syntax

```
Action: Park
ActionID: <value>
Channel: <value>
[TimeoutChannel: ] <value>
[AnnounceChannel: ] <value>
[Timeout: ] <value>
[Parkinglot: ] <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel** - Channel name to park.
- **TimeoutChannel** - Channel name to use when constructing the dial string that will be dialed if the parked channel times out. If TimeoutChannel is in a two party bridge with Channel, then TimeoutChannel will receive an announcement and be treated as having parked Channel in the same manner as the Park Call DTMF feature.
- **AnnounceChannel** - If specified, then this channel will receive an announcement when Channel is parked if AnnounceChannel is in a state where it can receive announcements (AnnounceChannel must be bridged). AnnounceChannel has no bearing on the actual state of the parked call.
- **Timeout** - Overrides the timeout of the parking lot for this park action. Specified in milliseconds, but will be converted to seconds. Use a value of 0 to disable the timeout.
- **Parkinglot** - The parking lot to use when parking the channel

Asterisk 14 ManagerAction_PJSIPNotify

PJSIPNotify

Synopsis
Send a NOTIFY to either an endpoint or an arbitrary URI.

Description
Sends a NOTIFY to an endpoint or an arbitrary URI.

All parameters for this event must be specified in the body of this request via multiple `Variable: name=value` sequences.

```
<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>One (and only one) of Endpoint or URI must be specified. If URI is used, the default outbound endpoint will be used to send the message. If the default outbound endpoint isn't configured, this command can not send to an arbitrary URI.</td>
</tr>
</tbody>
</table>
```

Syntax

```
Action: PJSIPNotify
ActionID: <value>
[Endpoint: ] <value>
[URI: ] <value>
Variable: <value>
```

Arguments

- **ActionID**: ActionID for this transaction. Will be returned.
- **Endpoint**: The endpoint to which to send the NOTIFY.
- **URI**: Arbitrary URI to which to send the NOTIFY.
- **Variable**: Appends variables as headers/content to the NOTIFY. If the variable is named `Content`, then the value will compose the body of the message if another variable sets `Content-Type. name=value`

**Action_PJSIPShowEndpoint**

**PJSIPShowEndpoint**

**Synopsis**

Detail listing of an endpoint and its objects.

**Description**

Provides a detailed listing of options for a given endpoint. Events are issued showing the configuration and status of the endpoint and associated objects. These events include `EndpointDetail`, `AorDetail`, `AuthDetail`, `TransportDetail`, and `IdentifyDetail`. Some events may be listed multiple times if multiple objects are associated (for instance AoRs). Once all detail events have been raised a final `EndpointDetailComplete` event is issued.

**Syntax**

```
Action: PJSIPShowEndpoint
ActionID: <value>
Endpoint: <value>
```

**Arguments**

- **ActionID** - `ActionID` for this transaction. Will be returned.
- **Endpoint** - The endpoint to list.

QueueAdd

Synopsis
Add interface to queue.

Description

Syntax

Action: QueueAdd
ActionID: <value>
Queue: <value>
Interface: <value>
Penalty: <value>
Paused: <value>
MemberName: <value>
StateInterface: <value>

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Queue** - Queue's name.
- **Interface** - The name of the interface (tech/name) to add to the queue.
- **Penalty** - A penalty (number) to apply to this member. Asterisk will distribute calls to members with higher penalties only after attempting to distribute calls to those with lower penalty.
- **Paused** - To pause or not the member initially (true/false or 1/0).
- **MemberName** - Text alias for the interface.
- **StateInterface**

QueueReload

Synopsis

Reload a queue, queues, or any sub-section of a queue or queues.

Description

Syntax

```
Action: QueueReload
ActionID: <value>
Queue: <value>
Members: <value>
Rules: <value>
Parameters: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Queue** - The name of the queue to take action on. If no queue name is specified, then all queues are affected.
- **Members** - Whether to reload the queue's members.
  - yes
  - no
- **Rules** - Whether to reload queuerules.conf
  - yes
  - no
- **Parameters** - Whether to reload the other queue options.
  - yes
  - no

**Action_UpdateConfig**

**UpdateConfig**

**Synopsis**

Update basic configuration.

**Description**

This action will modify, create, or delete configuration elements in Asterisk configuration files.

**Syntax**

```
Action: UpdateConfig
ActionID: <value>
SrcFilename: <value>
DstFilename: <value>
Reload: <value>
PreserveEffectiveContext: <value>
Action-000000: <value>
Cat-000000: <value>
Var-000000: <value>
Value-000000: <value>
Match-000000: <value>
Line-000000: <value>
Options-000000: <value>
```

**Arguments**

- **ActionID** - ActionID for this transaction. Will be returned.
- **SrcFilename** - Configuration filename to read (e.g. foo.conf).
- **DstFilename** - Configuration filename to write (e.g. foo.conf).
- **Reload** - Whether or not a reload should take place (or name of specific module).
- **PreserveEffectiveContext** - Whether the effective category contents should be preserved on template change. Default is true (pre 13.2 behavior).
- **Action-000000** - Action to take.
  - 0's represent 6 digit number beginning with 000000.
    - NewCat
    - RenameCat
    - DelCat
    - EmptyCat
    - Update
    - Delete
    - Append
    - Insert
  - **Cat-000000** - Category to operate on.
    - 0's represent 6 digit number beginning with 000000.
  - **Var-000000** - Variable to work on.
    - 0's represent 6 digit number beginning with 000000.
  - **Value-000000** - Value to work on.
    - 0's represent 6 digit number beginning with 000000.
  - **Match-000000** - Extra match required to match line.
    - 0's represent 6 digit number beginning with 000000.
  - **Line-000000** - Line in category to operate on (used with delete and insert actions).
    - 0's represent 6 digit number beginning with 000000.
  - **Options-000000** - A comma separated list of action-specific options.
    - **NewCat** - One or more of the following...
      - allowdups - Allow duplicate category names.
      - template - This category is a template.
      - inherit="template,..." - Templates from which to inherit.

The following actions share the same options...

- **RenameCat**
- **DelCat**
- **EmptyCat**
- **Update**
- **Delete**
- **Append**
- Insert
- catfilter="<expression>,..."

A comma separated list of `name_regex=value_regex` expressions which will cause only categories whose variables match all expressions to be considered. The special variable name `TEMPLATES` can be used to control whether templates are included. Passing `include` as the value will include templates along with normal categories. Passing `restrict` as the value will restrict the operation to ONLY templates. Not specifying a `TEMPLATES` expression results in the default behavior which is to not include templates.

catfilter is most useful when a file contains multiple categories with the same name and you wish to operate on specific ones instead of all of them.

0's represent 6 digit number beginning with 000000.

**Action_VoicemailRefresh**

**VoicemailRefresh**

**Synopsis**
Tell Asterisk to poll mailboxes for a change

**Description**
Normally, MWI indicators are only sent when Asterisk itself changes a mailbox. With external programs that modify the content of a mailbox from outside the application, an option exists called `pollmailboxes` that will cause voicemail to continually scan all mailboxes on a system for changes. This can cause a large amount of load on a system. This command allows external applications to signal when a particular mailbox has changed, thus permitting external applications to modify mailboxes and MWI to work without introducing considerable CPU load.

If `Context` is not specified, all mailboxes on the system will be polled for changes. If `Context` is specified, but `Mailbox` is omitted, then all mailboxes within `Context` will be polled. Otherwise, only a single mailbox will be polled for changes.

**Syntax**

```
Action: VoicemailRefresh
ActionID: <value>
Context: <value>
Mailbox: <value>
```

**Arguments**

- **ActionID** - ActionID for this transaction. Will be returned.
- **Context**
- **Mailbox**

**Event_Agents**

**Agents**

**Synopsis**

Response event in a series to the Agents AMI action containing information about a defined agent.

**Description**

The channel snapshot is present if the Status value is **AGENT_IDLE** or **AGENT_ONCALL**.

**Syntax**

```
Event: Agents
Agent: <value>
Name: <value>
Status: <value>
TalkingToChan: <value>
CallStarted: <value>
LoggedinTime: <value>
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
ActionID: <value>
```

**Arguments**

- **Agent** - Agent ID of the agent.
- **Name** - User friendly name of the agent.
- **Status** - Current status of the agent.
  
  The valid values are:
  - **AGENT_LOGGEDOFF**
  - **AGENT_IDLE**
  - **AGENT_ONCALL**
- **TalkingToChan** - BRIDGEPEER value on agent channel.
  
  Present if Status value is **AGENT_ONCALL**.
- **CallStarted** - Epoch time when the agent started talking with the caller.
  
  Present if Status value is **AGENT_ONCALL**.
- **LoggedinTime** - Epoch time when the agent logged in.
  
  Present if Status value is **AGENT_IDLE** or **AGENT_ONCALL**.
- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - **Down**
  - **Rsrvd**
  - **OffHook**
  - **Dialing**
  - **Ring**
  - **Ringing**
  - **Up**
  - **Busy**
  - **Dialing Offhook**
  - **Pre-ring**
  - **Unknown**
- **CallerIDNum**
- **CallerIDName**
- **ConnectedLineNum**
- **ConnectedLineName**
- **AccountCode**
- **Context**
- **Exten**
- Priority
- Uniqueid
- Linkedin - Uniqueid of the oldest channel associated with this channel.
- ActionID - ActionID for this transaction. Will be returned.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 ManagerEvent_AorDetail

AorDetail

Synopsis

Provide details about an Address of Record (AoR) section.

Description

Syntax

```plaintext
Event: AorDetail
ObjectType: <value>
ObjectName: <value>
MinimumExpiration: <value>
MaximumExpiration: <value>
DefaultExpiration: <value>
QualifyFrequency: <value>
AuthenticateQualify: <value>
MaxContacts: <value>
RemoveExisting: <value>
Mailboxes: <value>
OutboundProxy: <value>
SupportPath: <value>
TotalContacts: <value>
ContactsRegistered: <value>
EndpointName: <value>
```

Arguments

- **ObjectType** - The object's type. This will always be 'aor'.
- **ObjectName** - The name of this object.
- **MinimumExpiration** - Minimum keep alive time for an AoR
- **MaximumExpiration** - Maximum time to keep an AoR
- **DefaultExpiration** - Default expiration time in seconds for contacts that are dynamically bound to an AoR.
- **QualifyFrequency** - Interval at which to qualify an AoR
- **AuthenticateQualify** - Authenticates a qualify request if needed
- **MaxContacts** - Maximum number of contacts that can bind to an AoR
- **RemoveExisting** - Determines whether new contacts replace existing ones.
- **Mailboxes** - Allow subscriptions for the specified mailbox(es)
- **OutboundProxy** - Outbound proxy used when sending OPTIONS request
- **SupportPath** - Enables Path support for REGISTER requests and Route support for other requests.
- **TotalContacts** - The total number of contacts associated with this AoR.
- **ContactsRegistered** - The number of non-permanent contacts associated with this AoR.
- **EndpointName** - The name of the endpoint associated with this information.

Asterisk 14 ManagerEventAsyncAGIEnd

AsyncAGIEnd

Synopsis
Raised when a channel stops AsyncAGI command processing.

Description

Syntax

```
Event: AsyncAGIEnd
  Channel: <value>
  ChannelState: <value>
  ChannelStateDesc: <value>
  CallerIDNum: <value>
  CallerIDName: <value>
  ConnectedLineNum: <value>
  ConnectedLineName: <value>
  AccountCode: <value>
  Context: <value>
  Exten: <value>
  Priority: <value>
  Uniqueid: <value>
  Linkedid: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- **CallerIDNum**
- **CallerIDName**
- **ConnectedLineNum**
- **ConnectedLineName**
- **AccountCode**
- **Context**
- **Exten**
- **Priority**
- **Uniqueid**
- **Linkedid** - Uniqueid of the oldest channel associated with this channel.

Event_AsyncAGIExec

AsyncAGIExec

Synopsis

Raised when AsyncAGI completes an AGI command.

Description

Syntax

Event: AsyncAGIExec
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
[CommandID:] <value>
Result: <value>

Arguments

- **Channel**
  - **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
  - **ChannelStateDesc**
    - Down
    - Rsvrd
    - OffHook
    - Dialing
    - Ring
    - Ringing
    - Up
    - Busy
    - Dialing Offhook
    - Pre-ring
    - Unknown
- **CallerIDNum**
- **CallerIDName**
- **ConnectedLineNum**
- **ConnectedLineName**
- **AccountCode**
- **Context**
- **Exten**
- **Priority**
- **Uniqueid**
- **Linkedid** - Uniqueid of the oldest channel associated with this channel.
- **CommandID** - Optional command ID sent by the AsyncAGI server to identify the command.
- **Result** - URL encoded result string from the executed AGI command.

Class

Event_AsyncAGIStart

AsyncAGIStart

Synopsis

Raised when a channel starts AsyncAGI command processing.

Description

Syntax

```plaintext
Event: AsyncAGIStart
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
Env: <value>
```

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsvrd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- Linkedid - Uniqueid of the oldest channel associated with this channel.
- Env - URL encoded string read from the AsyncAGI server.

Class

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 ManagerEvent_AttendedTransfer

AttendedTransfer

Synopsis

Raised when an attended transfer is complete.

Description

The headers in this event attempt to describe all the major details of the attended transfer. The two transferer channels and the two bridges are determined based on their chronological establishment. So consider that Alice calls Bob, and then Alice transfers the call to Voicemail. The transferer and bridge headers would be arranged as follows:

- **OrigTransfererChannel**: Alice's channel in the bridge with Bob.
- **OrigBridgeUniqueid**: The bridge between Alice and Bob.
- **SecondTransfererChannel**: Alice's channel that called Voicemail.
- **SecondBridgeUniqueid**: Not present, since a call to Voicemail has no bridge.

Now consider if the order were reversed; instead of having Alice call Bob and transfer him to Voicemail, Alice instead calls her Voicemail and transfers that to Bob. The transferer and bridge headers would be arranged as follows:

- **OrigTransfererChannel**: Alice's channel that called Voicemail.
- **OrigBridgeUniqueid**: Not present, since a call to Voicemail has no bridge.
- **SecondTransfererChannel**: Alice's channel in the bridge with Bob.
- **SecondBridgeUniqueid**: The bridge between Alice and Bob.

• Result - Indicates if the transfer was successful or if it failed.
  • Fail - An internal error occurred.
  • Invalid - Invalid configuration for transfer (e.g. Not bridged)
  • Not Permitted - Bridge does not permit transfers
  • Success - Transfer completed successfully

Note

A result of Success does not necessarily mean that a target was successfully contacted. It means that a party was successfully placed into the dialplan at the expected location.

• OrigTransfererChannel
• OrigTransfererChannelState - A numeric code for the channel's current state, related to OrigTransfererChannelStateDesc
• OrigTransfererChannelStateDesc
  • Down
  • Rsrvd
  • OffHook

• SecondBridgeUniqueid
• SecondBridgeType - The type of bridge
• SecondBridgeTechnology - Technology in use by the bridge
• SecondBridgeCreator - Entity that created the bridge if applicable
• SecondBridgeName - Name used to refer to the bridge by its BridgeCreator if applicable
• SecondBridgeNumChannels - Number of channels in the bridge
• **DestType** - Indicates the method by which the attended transfer completed.
  - **Bridge** - The transfer was accomplished by merging two bridges into one.
  - **App** - The transfer was accomplished by having a channel or bridge run a dialplan application.
  - **Link** - The transfer was accomplished by linking two bridges together using a local channel pair.
  - **Threeway** - The transfer was accomplished by placing all parties into a threeway call.
  - **Fail** - The transfer failed.
• **DestBridgeUniqueid** - Indicates the surviving bridge when bridges were merged to complete the transfer

<table>
<thead>
<tr>
<th>Note</th>

Asterisk 14 Manager Event_AuthDetail

AuthDetail

Synopsis

Provide details about an authentication section.

Description

Syntax

```plaintext
Event: AuthDetail
ObjectType: <value>
ObjectName: <value>
Username: <value>
Password: <value>
Md5Cred: <value>
Realm: <value>
NonceLifetime: <value>
AuthType: <value>
EndpointName: <value>
```

Arguments

- **ObjectType** - The object's type. This will always be 'auth'.
- **ObjectName** - The name of this object.
- **Username** - Username to use for account
- **Password** - Username to use for account
- **Md5Cred** - MD5 Hash used for authentication.
- **Realm** - SIP realm for endpoint
- **NonceLifetime** - Lifetime of a nonce associated with this authentication config.
- **AuthType** - Authentication type
- **EndpointName** - The name of the endpoint associated with this information.

Event_AuthMethodNotAllowed

AuthMethodNotAllowed

Synopsis

Raised when a request used an authentication method not allowed by the service.

Description

Syntax

```plaintext
Event: AuthMethodNotAllowed
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
AuthMethod: <value>
[Module: ] <value>
[SessionTV: ] <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- AuthMethod - The authentication method attempted.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Event_Cdr

Cdr

Synopsis

Raised when a CDR is generated.

Description

The Cdr event is only raised when the cdr_manager backend is loaded and registered with the CDR engine.

Note

This event can contain additional fields depending on the configuration provided by cdr_manager.conf.

Syntax

```
Event: Cdr
AccountCode: <value>
Source: <value>
Destination: <value>
DestinationContext: <value>
CallerID: <value>
Channel: <value>
DestinationChannel: <value>
LastApplication: <value>
LastData: <value>
StartTime: <value>
AnswerTime: <value>
EndTime: <value>
Duration: <value>
BillableSeconds: <value>
Disposition: <value>
AMAFlags: <value>
UniqueID: <value>
UserField: <value>
```

Arguments

- **AccountCode** - The account code of the Party A channel.
- **Source** - The Caller ID number associated with the Party A in the CDR.
- **Destination** - The dialplan extension the Party A was executing.
- **DestinationContext** - The dialplan context the Party A was executing.
- **CallerID** - The Caller ID name associated with the Party A in the CDR.
- **Channel** - The channel name of the Party A.
- **DestinationChannel** - The channel name of the Party B.
- **LastApplication** - The last dialplan application the Party A executed.
- **LastData** - The parameters passed to the last dialplan application the Party A executed.
- **StartTime** - The time the CDR was created.
- **AnswerTime** - The earliest of either the time when Party A answered, or the start time of this CDR.
- **EndTime** - The time when the CDR was finished. This occurs when the Party A hangs up or when the bridge between Party A and Party B is broken.
- **Duration** - The time, in seconds, of **EndTime** - **StartTime**.
- **BillableSeconds** - The time, in seconds, of **AnswerTime** - **StartTime**.
- **Disposition** - The final known disposition of the CDR.
  - **NO ANSWER** - The channel was not answered. This is the default disposition.
  - **FAILED** - The channel attempted to dial but the call failed.
  - **BUSY** - The channel attempted to dial but the remote party was busy.
  - **ANSWERED** - The channel was answered. The hang up cause will no longer impact the disposition of the CDR.
  - **CONGESTION** - The channel attempted to dial but the remote party was congested.
- **AMAFlags** - A flag that informs a billing system how to treat the CDR.
  - **OMIT** - This CDR should be ignored.
  - **BILLING** - This CDR contains valid billing data.
  - **DOCUMENTATION** - This CDR is for documentation purposes.

Note

The congestion setting in cdr.conf can result in the AST_CAUSE_CONGESTION hang up cause or the CONGESTION dial status to map to this disposition.
- **UniqueID**: A unique identifier for the Party A channel.
- **UserField**: A user defined field set on the channels. If set on both the Party A and Party B channel, the userfields of both are concatenated and separated by a `;`.

**Class**

**CDR**

Event CEL

Synopsis

Raised when a Channel Event Log is generated for a channel.

Description

Syntax

```
Event: CEL
EventName: <value>
AccountCode: <value>
CallerIDnum: <value>
CallerIDname: <value>
CallerIDani: <value>
CallerIDrdnis: <value>
CallerIDdnid: <value>
Exten: <value>
Context: <value>
Application: <value>
AppData: <value>
EventTime: <value>
AMAFlags: <value>
UniqueID: <value>
LinkedID: <value>
UserField: <value>
Peer: <value>
PeerAccount: <value>
Extra: <value>
```

Arguments

- **EventName** - The name of the CEL event being raised. This can include both the system defined CEL events, as well as user defined events.

  • **CHAN_START** - A channel was created.
  • **CHAN_END** - A channel was terminated.
  • **ANSWER** - A channel answered.
  • **HANGUP** - A channel was hung up.
  • **BRIDGE_ENTER** - A channel entered a bridge.
  • **BRIDGE_EXIT** - A channel left a bridge.
  • **APP_START** - A channel entered into a tracked application.
  • **APP_END** - A channel left a tracked application.
  • **PARK_START** - A channel was parked.
  • **PARK_END** - A channel was unparked.
  • **BLINDTRANSFER** - A channel initiated a blind transfer.
  • **ATTENEDTRANSFER** - A channel initiated an attended transfer.
  • **PICKUP** - A channel initiated a call pickup.
  • **FORWARD** - A channel is being forwarded to another destination.
  • **LINKEDID_END** - The linked ID associated with this channel is being retired.
  • **LOCAL_OPTIMIZE** - A Local channel optimization has occurred.
  • **USER_DEFINED** - A user defined type.

  **Note**
  All events listed here may not be raised, depending on the configuration in `cel.conf`.

  - **AccountCode** - The channel's account code.
  - **CallerIDnum** - The Caller ID number.
  - **CallerIDname** - The Caller ID name.
  - **CallerIDani** - The Caller ID Automatic Number Identification.
  - **CallerIDrdnis** - The Caller ID Redirected Dialed Number Identification Service.
  - **CallerIDdnid** - The Caller ID Dialed Number Identifier.
  - **Exten** - The dialplan extension the channel is currently executing in.

  **Note**
  This event is only present if `show_user_defined` in `cel.conf` is `True`. Otherwise, the user defined event will be placed directly in the **EventName** field.
- **Context** - The dialplan context the channel is currently executing in.
- **Application** - The dialplan application the channel is currently executing.
- **AppData** - The arguments passed to the dialplan Application.
- **EventTime** - The time the CEL event occurred.
- **AMAFlags** - A flag that informs a billing system how to treat the CEL.
  - **OMIT** - This event should be ignored.
  - **BILLING** - This event contains valid billing data.
  - **DOCUMENTATION** - This event is for documentation purposes.
- **UniqueID** - The unique ID of the channel.
- **LinkedID** - The linked ID of the channel, which ties this event to other related channel's events.
- **UserField** - A user defined field set on a channel, containing arbitrary application specific data.
- **Peer** - If this channel is in a bridge, the channel that it is in a bridge with.
- **PeerAccount** - If this channel is in a bridge, the accountcode of the channel it is in a bridge with.
- **Extra** - Some events will have event specific data that accompanies the CEL record. This extra data is JSON encoded, and is dependent on the event in question.

**Class**

Asterisk 14 ManagerEvent_ChallengeResponseFailed

ChallengeResponseFailed

Synopsis

Raised when a request’s attempt to authenticate has been challenged, and the request failed the authentication challenge.

Description

Syntax

```plaintext
Event: ChallengeResponseFailed
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
Challenge: <value>
Response: <value>
ExpectedResponse: <value>
[Module:]: <value>
[SessionTV:]: <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- Challenge - The challenge that was sent.
- Response - The response that was received.
- ExpectedResponse - The expected response to the challenge.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Asterisk 14 Manager Event_ChallengeSent

ChallengeSent

Synopsis
Raised when an Asterisk service sends an authentication challenge to a request.

Description

Syntax

```
Event: ChallengeSent
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
Challenge: <value>
[Module:] <value>
[SessionTV:] <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- Challenge - The challenge that was sent.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Asterisk 14 ManagerEvent_ChannelTalkingStart

ChannelTalkingStart

Synopsis

Raised when talking is detected on a channel.

Description

Syntax

```
Event: ChannelTalkingStart
  Channel: <value>
  ChannelState: <value>
  ChannelStateDesc: <value>
  CallerIDNum: <value>
  CallerIDName: <value>
  ConnectedLineNum: <value>
  ConnectedLineName: <value>
  AccountCode: <value>
  Context: <value>
  Exten: <value>
  Priority: <value>
  Uniqueid: <value>
  Linkedid: <value>
```

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- Linkedid - Uniqueid of the oldest channel associated with this channel.

Event_ConfbridgeUnmute

ConfbridgeUnmute

Synopsis
Raised when a confbridge participant unmutes.

Description

Syntax

```
Event: ConfbridgeUnmute
Conference: <value>
BridgeUniqueid: <value>
BridgeType: <value>
BridgeTechnology: <value>
BridgeCreator: <value>
BridgeName: <value>
BridgeNumChannels: <value>
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
Admin: <value>
```

Arguments

- Conference - The name of the Confbridge conference.
- BridgeUniqueid
- BridgeType - The type of bridge
- BridgeTechnology - Technology in use by the bridge
- BridgeCreator - Entity that created the bridge if applicable
- BridgeName - Name used to refer to the bridge by its BridgeCreator if applicable
- BridgeNumChannels - Number of channels in the bridge
- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing

Asterisk 14 ManagerEvent>ContactStatus

ContactStatus

Synopsis

Raised when the state of a contact changes.

Description

Syntax

```
Event: ContactStatus
URI: <value>
ContactStatus: <value>
AOR: <value>
EndpointName: <value>
RoundtripUsec: <value>
UserAgent: <value>
RegExpire: <value>
ViaAddress: <value>
CallID: <value>
```

Arguments

- **URI** - This contact's URI.
- **ContactStatus** - New status of the contact.
  - Unknown
  - Unreachable
  - Reachable
  - Created
  - Removed
  - Updated
- **AOR** - The name of the associated aor.
- **EndpointName** - The name of the associated endpoint.
- **RoundtripUsec** - The RTT measured during the last qualify.
- **UserAgent** - Content of the User-Agent header in REGISTER request
- **RegExpire** - Absolute time that this contact is no longer valid after
- **ViaAddress** - IP address:port of the last Via header in REGISTER request
- **CallID** - Content of the Call-ID header in REGISTER request

Asterisk 14 ManagerEvent_ContactStatusDetail

ContactStatusDetail

Synopsis

Provide details about a contact's status.

Description

Syntax

```
Event: ContactStatusDetail
AOR: <value>
URI: <value>
Status: <value>
RoundtripUsec: <value>
EndpointName: <value>
UserAgent: <value>
RegExpires: <value>
ViaAddress: <value>
CallID: <value>
```

Arguments

- **AOR** - The AoR that owns this contact.
- **URI** - This contact's URI.
- **Status** - This contact's status.
  - **Reachable**
  - **Unreachable**
- **RoundtripUsec** - The round trip time in microseconds.
- **EndpointName** - The name of the endpoint associated with this information.
- **UserAgent** - Content of the User-Agent header in REGISTER request
- **RegExpires** - Absolute time that this contact is no longer valid after
- **ViaAddress** - IP address:port of the last Via header in REGISTER request
- **CallID** - Content of the Call-ID header in REGISTER request

Event_CoreShowChannel

CoreShowChannel

Synopsis

Raised in response to a CoreShowChannels command.

Description

Syntax

Event: CoreShowChannel
ActionID: <value>
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
BridgeId: <value>
Application: <value>
ApplicationData: <value>
Duration: <value>

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsvrd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- **CallerIDNum**
- **CallerIDName**
- **ConnectedLineNum**
- **ConnectedLineName**
- **AccountCode**
- **Context**
- **Exten**
- **Priority**
- **Uniqueid**
- **Linkedid** - Uniqueid of the oldest channel associated with this channel.
- **BridgeId** - Identifier of the bridge the channel is in, may be empty if not in one
- **Application** - Application currently executing on the channel
- **ApplicationData** - Data given to the currently executing application
- **Duration** - The amount of time the channel has existed

CoreShowChannelsComplete

Synopsis

Raised at the end of the CoreShowChannel list produced by the CoreShowChannels command.

Description

Syntax

```
Event: CoreShowChannelsComplete
ActionID: <value>
EventList: <value>
ListItems: <value>
```

Arguments

- **ActionID** - ActionID for this transaction. Will be returned.
- **EventList** - Conveys the status of the command response list
- **ListItems** - The total number of list items produced

Asterisk 14 ManagerEvent_DAHDICannel

DAHDICannel

Synopsis
Raised when a DAHDI channel is created or an underlying technology is associated with a DAHDI channel.

Description

Syntax

```plaintext
Event: DAHDICannel
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
DAHDISpan: <value>
DAHDICannel: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook

Asterisk 14 ManagerEvent_DeviceStateChange

DeviceStateChange

Synopsis

Raised when a device state changes

Description

This differs from the ExtensionStatus event because this event is raised for all device state changes, not only for changes that affect dialplan hints.

Syntax

```
Event: DeviceStateChange
Device: <value>
State: <value>
```

Arguments

- **Device**: The device whose state has changed
- **State**: The new state of the device

DeviceStateListComplete

Synopsis
Indicates the end of the list the current known extension states.

Description

Syntax

```
Event: DeviceStateListComplete
EventList: <value>
ListItems: <value>
```

Arguments

- EventList - Conveys the status of the event list.
- ListItems - Conveys the number of statuses reported.

Event_DNDState

DNDState

Synopsis

Raised when the Do Not Disturb state is changed on a DAHDI channel.

Description

Syntax

Event: DNDState
DAHDIChannel: <value>
Status: <value>

Arguments

- **DAHDIChannel** - The DAHDI channel on which DND status changed.

  **Note**
  This is not an Asterisk channel identifier.

- **Status**
  - enabled
  - disabled

Arguments

- **ObjectType** - The object's type. This will always be 'endpoint'.
- **ObjectName** - The name of this object.
- **Context** - Dialplan context for inbound sessions
- **Disallow** - Media Codec(s) to disallow
- **Allow** - Media Codec(s) to allow
- **DtmfMode** - DTMF mode
- **RtpIpv6** - Allow use of IPv6 for RTP traffic
- **RtpSymmetric** - Enforce that RTP must be symmetric
- **IceSupport** - Enable the ICE mechanism to help traverse NAT
- **UseRtpTime** - Use Endpoint's requested packetisation interval
- **ForceRport** - Force use of return port
- **RewriteContact** - Allow Contact header to be rewritten with the source IP address-port
- **Transport** - Desired transport configuration
- **OutboundProxy** - Proxy through which to send requests, a full SIP URI must be provided
- **MohSuggest** - Default Music On Hold class
- **100rel** - Allow support for RFC3262 provisional ACK tags
- **Timers** - Session timers for SIP packets
- **TimersMinSe** - Minimum session timers expiration period
- **TimersSessExpires** - Maximum session timer expiration period
- **Auth** - Authentication Object(s) associated with the endpoint
- **OutboundAuth** - Authentication object used for outbound requests
- **Aors** - AoR(s) to be used with the endpoint
- **MediaAddress** - IP address used in SDP for media handling
- **IdentifyBy** - Way(s) for Endpoint to be identified
- **DirectMedia** - Determines whether media may flow directly between endpoints.
- **DirectMediaMethod** - Direct Media method type
- **ConnectedLineMethod** - Connected line method type
- **DirectMediaGlareMitigation** - Mitigation of direct media (re)INVITE glare
- **Callerid** - CallerID information for the endpoint
- **CalleridPrivacy** - Default privacy level
- **CalleridTag** - Internal id_tag for the endpoint
- **TrustIdInbound** - Accept identification information received from this endpoint
- **TrustIdOutbound** - Send private identification details to the endpoint.
- **SendPai** - Send the P-Asserted-Identity header
- **SendRpid** - Send the Remote-Party-ID header
- **SendDivers** - Send the Diversion header, conveying the diversion information to the called user agent
- **Mailboxes** - NOTIFY the endpoint when state changes for any of the specified mailboxes
- **AggregateMwi** - Condense MWI notifications into a single NOTIFY.
- **MediaEncryption** - Determines whether res_pjsip will use and enforce usage of media encryption for this endpoint.
- **MediaEncryptionOptimistic** - Determines whether encryption should be used if possible but does not terminate the session if not achieved.
- **UseAvpf** - Determines whether res_pjsip will use and enforce usage of AVPF for this endpoint.
- **ForceAvp** - Determines whether res_pjsip will use and enforce usage of AVP, regardless of the RTP profile in use for this endpoint.
- **MediaUseReceivedTransport** - Determines whether res_pjsip will use the media transport received in the offer SDP in the corresponding answer SDP.
- **OneTouchRecording** - Determines whether one-touch recording is allowed for this endpoint.
- **InbandProgress** - Determines whether chan_pjsip will indicate ringing using inband progress.
- **CallGroup** - The numeric pickup groups for a channel.
- **PickupGroup** - The numeric pickup groups that a channel can pickup.
- **NamedCallGroup** - The named pickup groups for a channel.
- **NamedPickupGroup** - The named pickup groups that a channel can pickup.
- **DeviceStateBusyAt** - The number of in-use channels which will cause busy to be returned as device state
- **T38Udptl** - Whether T.38 UDPTL support is enabled or not
- **T38UdptlEc** - T.38 UDPTL error correction method
- **T38UdptlMaxdatagram** - T.38 UDPTL maximum datagram size
- **FaxDetect** - Whether CNG tone detection is enabled
- **T38UdptlNat** - Whether NAT support is enabled on UDPTL sessions
- **T38UdptlIpv6** - Whether IPv6 is used for UDPTL Sessions
- **ToneZone** - Set which country's indications to use for channels created for this endpoint.
- **Language** - Set the default language to use for channels created for this endpoint.
- **RecordOnFeature** - The feature to enact when one-touch recording is turned on.
• **RecordOffFeature**: The feature to enact when one-touch recording is turned off.
• **AllowTransfer**: Determines whether SIP REFER transfers are allowed for this endpoint.
• **UserEqPhone**: Determines whether a user=phone parameter is placed into the request URI if the user is determined to be a phone number.
• **MohPassthrough**: Determines whether hold and unhold will be passed through using re-INVITEs with recvonly and sendrecv to the remote side.
• **SdpOwner**: String placed as the username portion of an SDP origin (o=) line.
• **SdpSession**: String used for the SDP session (s=) line.
• **TosAudio**: DSCP TOS bits for audio streams.
• **TosVideo**: DSCP TOS bits for video streams.
• **CosAudio**: Priority for audio streams.
• **CosVideo**: Priority for video streams.
• **AllowSubscribe**: Determines if endpoint is allowed to initiate subscriptions with Asterisk.
• **SubMinExpiry**: The minimum allowed expiry time for subscriptions initiated by the endpoint.
• **FromUser**: Username to use in From header for requests to this endpoint.
• **FromDomain**: Domain to user in From header for requests to this endpoint.
• **MwiFromUser**: Username to use in From header for unsolicited MWI NOTIFYs to this endpoint.
• **RtpEngine**: Name of the RTP engine to use for channels created for this endpoint.
• **DtlsVerify**: Verify that the provided peer certificate is valid.
• **DtlsRekey**: Interval at which to renegotiate the TLS session and rekey the SRTP session.
• **DtlsCertFile**: Path to certificate file to present to peer.
• **DtlsPrivateKey**: Path to private key for certificate file.
• **DtlsCipher**: Cipher to use for DTLS negotiation.
• **DtlsCaFile**: Path to certificate authority certificate.
• **DtlsCaPath**: Path to a directory containing certificate authority certificates.
• **DtlsSetup**: Whether we are willing to accept connections, connect to the other party, or both.
• **SrtpTag32**: Determines whether 32 byte tags should be used instead of 80 byte tags.
• **RedirectMethod**: How redirects received from an endpoint are handled.
• **SetVar**: Variable set on a channel involving the endpoint.
• **MessageContext**: Context to route incoming MESSAGE requests to.
• **Accountcode**: An accountcode to set automatically on any channels created for this endpoint.
• **DeviceState**: The aggregate device state for this endpoint.
• **ActiveChannels**: The number of active channels associated with this endpoint.
• **SubscribeContext**: Context for incoming MESSAGE requests.

Event_EndpointList

EndpointList

Synopsis

Provide details about a contact's status.

Description

Syntax

```
Event: EndpointList
ObjectType: <value>
ObjectName: <value>
Transport: <value>
Aor: <value>
Auths: <value>
OutboundAuths: <value>
DeviceState: <value>
ActiveChannels: <value>
```

Arguments

- **ObjectType** - The object's type. This will always be 'endpoint'.
- **ObjectName** - The name of this object.
- **Transport** - The transport configurations associated with this endpoint.
- **Aor** - The aor configurations associated with this endpoint.
- **Auths** - The inbound authentication configurations associated with this endpoint.
- **OutboundAuths** - The outbound authentication configurations associated with this endpoint.
- **DeviceState** - The aggregate device state for this endpoint.
- **ActiveChannels** - The number of active channels associated with this endpoint.

ExtensionStateListComplete

Synopsis
Indicates the end of the list the current known extension states.

Description

Syntax

```
Event: ExtensionStateListComplete
EventList: <value>
ListItems: <value>
```

Arguments

- `EventList` - Conveys the status of the event list.
- `ListItems` - Conveys the number of statuses reported.

Event_ExtensionStatus

ExtensionStatus

Synopsis

Raised when a hint changes due to a device state change.

Description

Syntax

```plaintext
Event: ExtensionStatus
Exten: <value>
Context: <value>
Hint: <value>
Status: <value>
StatusText: <value>
```

Arguments

- **Exten** - Name of the extension.
- **Context** - Context that owns the extension.
- **Hint** - Hint set for the extension
- **Status** - Numerical value of the extension status. Extension status is determined by the combined device state of all items contained in the hint.
  - -2 - The extension was removed from the dialplan.
  - -1 - The extension's hint was removed from the dialplan.
  - 0 - Idle - Related device(s) are in an idle state.
  - 1 - InUse - Related device(s) are in active calls but may take more calls.
  - 2 - Busy - Related device(s) are in active calls and may not take any more calls.
  - 4 - Unavailable - Related device(s) are not reachable.
  - 8 - Ringing - Related device(s) are currently ringing.
  - 9 - InUse&Ringing - Related device(s) are currently ringing and in active calls.
  - 16 - Hold - Related device(s) are currently on hold.
  - 17 - InUse&Hold - Related device(s) are currently on hold and in active calls.
- **StatusText** - Text representation of **Status**.
  - Idle
  - InUse
  - Busy
  - Unavailable
  - Ringing
  - InUse&Ringing
  - Hold
  - InUse&Hold
  - Unknown - Status does not match any of the above values.

Event_FailedACL

FailedACL

Synopsis

Raised when a request violates an ACL check.

Description

Syntax

```
Event: FailedACL
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
[Module: ] <value>
[ACLName: ] <value>
[SessionTV: ] <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- Module - If available, the name of the module that raised the event.
- ACLName - If available, the name of the ACL that failed.
- SessionTV - The timestamp reported by the session.

Asterisk 14 ManagerEvent_FAXSession

FAXSession

Synopsis

Raised in response to FAXSession manager command

Description

Syntax

```
Event: FAXSession
   [ActionID: ] <value>
   SessionNumber: <value>
   Operation: <value>
   State: <value>
   [ErrorCorrectionMode: ] <value>
   [DataRate: ] <value>
   [ImageResolution: ] <value>
   [PageNumber: ] <value>
   [FileName: ] <value>
   [PagesTransmitted: ] <value>
   [PagesReceived: ] <value>
   [TotalBadLines: ] <value>
```

Arguments

- **ActionID**
- **SessionNumber** - The numerical identifier for this particular session
- **Operation** - FAX session operation type
  - gateway
  - V.21
  - send
  - receive
  - none
- **State** - Current state of the FAX session
  - Uninitialized
  - Initialized
  - Open
  - Active
  - Complete
  - Reserved
  - Inactive
  - Unknown
- **ErrorCorrectionMode** - Whether error correcting mode is enabled for the FAX session. This field is not included when operation is 'V.21 Detect' or if operation is 'gateway' and state is 'Uninitialized'
  - yes
  - no
- **DataRate** - Bit rate of the FAX. This field is not included when operation is 'V.21 Detect' or if operation is 'gateway' and state is 'Uninitialized'.
- **ImageResolution** - Resolution of each page of the FAX. Will be in the format of X_RESxY_RES. This field is not included if the operation is anything other than Receive/Transmit.
- **PageNumber** - Current number of pages transferred during this FAX session. May change as the FAX progresses. This field is not included when operation is 'V.21 Detect' or if operation is 'gateway' and state is 'Uninitialized'.
- **FileName** - Filename of the image being sent/received for this FAX session. This field is not included if Operation isn’t 'send' or 'receive'.
- **PagesTransmitted** - Total number of pages sent during this session. This field is not included if Operation isn’t 'send' or 'receive'. Will always be 0 for 'receive'.
- **PagesReceived** - Total number of pages received during this session. This field is not included if Operation is not 'send' or 'receive'. Will be 0 for 'send'.
- **TotalBadLines** - Total number of bad lines sent/received during this session. This field is not included if Operation is not 'send' or 'receive'.

Asterisk 14 ManagerEvent_FAXSessionsEntry

FAXSessionsEntry

Synopsis
A single list item for the FAXSessions AMI command

Description

Syntax

<table>
<thead>
<tr>
<th>Event: FAXSessionsEntry</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ActionID: ] &lt;value&gt;</td>
</tr>
<tr>
<td>Channel: &lt;value&gt;</td>
</tr>
<tr>
<td>Technology: &lt;value&gt;</td>
</tr>
<tr>
<td>SessionNumber: &lt;value&gt;</td>
</tr>
<tr>
<td>SessionType: &lt;value&gt;</td>
</tr>
<tr>
<td>Operation: &lt;value&gt;</td>
</tr>
<tr>
<td>State: &lt;value&gt;</td>
</tr>
<tr>
<td>Files: &lt;value&gt;</td>
</tr>
</tbody>
</table>

Arguments

- **ActionID** - Name of the channel responsible for the FAX session
- **Channel** - The FAX technology that the FAX session is using
- **Technology** - The numerical identifier for this particular session
- **SessionNumber** - FAX session passthru/relay type
  - G.711
  - T.38
- **Operation** - FAX session operation type
  - gateway
  - V.21
  - send
  - receive
  - none
- **State** - Current state of the FAX session
  - Uninitialized
  - Initialized
  - Open
  - Active
  - Complete
  - Reserved
  - Inactive
  - Unknown
- **Files** - File or list of files associated with this FAX session

Asterisk 14 ManagerEvent_FAXStats

FAXStats

Synopsis

Raised in response to FAXStats manager command

Description

Syntax

```
Event: FAXStats
[ActionID: <value>]
CurrentSessions: <value>
ReservedSessions: <value>
TransmitAttempts: <value>
ReceiveAttempts: <value>
CompletedFAXes: <value>
FailedFAXes: <value>
```

Arguments

- **ActionID**
- **CurrentSessions** - Number of active FAX sessions
- **ReservedSessions** - Number of reserved FAX sessions
- **TransmitAttempts** - Total FAX sessions for which Asterisk is/was the transmitter
- **ReceiveAttempts** - Total FAX sessions for which Asterisk is/was the recipient
- **CompletedFAXes** - Total FAX sessions which have been completed successfully
- **FailedFAXes** - Total FAX sessions which failed to complete successfully

Event_FAXStatus

FAXStatus

Synopsis

Raised periodically during a fax transmission.

Description

Syntax

```plaintext
Event: FAXStatus
   Channel: <value>
   ChannelState: <value>
   ChannelStateDesc: <value>
   CallerIDNum: <value>
   CallerIDName: <value>
   ConnectedLineNum: <value>
   ConnectedLineName: <value>
   AccountCode: <value>
   Context: <value>
   Exten: <value>

   Uniqueid: <value>
   Linkedid: <value>
   Operation: <value>
   Status: <value>
   LocalStationID: <value>
   FileName: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsvrd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- **CallerIDNum**
- **CallerIDName**
- **ConnectedLineNum**
- **ConnectedLineName**
- **AccountCode**
- **Context**
- **Exten**
- **Priority**
- **Uniqueid**
- **Linkedid** - Uniqueid of the oldest channel associated with this channel.
- **Operation**
  - gateway
  - receive
  - send
- **Status** - A text message describing the current status of the fax
- **LocalStationID** - The value of the LOCALSTATIONID channel variable
- **FileName** - The files being affected by the fax operation

Asterisk 14 ManagerEvent_InvalidAccountID

InvalidAccountID

Synopsis

Raised when a request fails an authentication check due to an invalid account ID.

Description

Syntax

```
Event: InvalidAccountID
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
[Module: ] <value>
[SessionTV: ] <value>
```

Arguments

- `EventTV` - The time the event was detected.
- `Severity` - A relative severity of the security event.
  - Informational
  - Error
- `Service` - The Asterisk service that raised the security event.
- `EventVersion` - The version of this event.
- `AccountID` - The Service account associated with the security event notification.
- `SessionID` - A unique identifier for the session in the service that raised the event.
- `LocalAddress` - The address of the Asterisk service that raised the security event.
- `RemoteAddress` - The remote address of the entity that caused the security event to be raised.
- `Module` - If available, the name of the module that raised the event.
- `SessionTV` - The timestamp reported by the session.

Event_InvalidPassword

InvalidPassword

Synopsis

Raised when a request provides an invalid password during an authentication attempt.

Description

Syntax

```plaintext
Event: InvalidPassword
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
[Module:] <value>
[SessionTV:] <value>
[Challenge:] <value>
[ReceivedChallenge:] <value>
[RecievedHash:] <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.
- Challenge - The challenge that was sent.
- ReceivedChallenge - The challenge that was received.
- ReceivedHash - The hash that was received.

Asterisk 14 ManagerEvent_InvalidTransport

InvalidTransport

Synopsis

Raised when a request attempts to use a transport not allowed by the Asterisk service.

Description

Syntax

```plaintext
Event: InvalidTransport
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
AttemptedTransport: <value>
[Module:] <value>
[SessionTV:] <value>
```

Arguments

- **EventTV** - The time the event was detected.
- **Severity** - A relative severity of the security event.
  - Informational
  - Error
- **Service** - The Asterisk service that raised the security event.
- **EventVersion** - The version of this event.
- **AccountID** - The Service account associated with the security event notification.
- **SessionID** - A unique identifier for the session in the service that raised the event.
- **LocalAddress** - The address of the Asterisk service that raised the security event.
- **RemoteAddress** - The remote address of the entity that caused the security event to be raised.
- **AttemptedTransport** - The transport type that the request attempted to use.
- **Module** - If available, the name of the module that raised the event.
- **SessionTV** - The timestamp reported by the session.

Event_LoadAverageLimit

LoadAverageLimit

Synopsis

Raised when a request fails because a configured load average limit has been reached.

Description

Syntax

<table>
<thead>
<tr>
<th>Event: LoadAverageLimit</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventTV: &lt;value&gt;</td>
</tr>
<tr>
<td>Severity: &lt;value&gt;</td>
</tr>
<tr>
<td>Service: &lt;value&gt;</td>
</tr>
<tr>
<td>EventVersion: &lt;value&gt;</td>
</tr>
<tr>
<td>AccountID: &lt;value&gt;</td>
</tr>
<tr>
<td>SessionID: &lt;value&gt;</td>
</tr>
<tr>
<td>LocalAddress: &lt;value&gt;</td>
</tr>
<tr>
<td>RemoteAddress: &lt;value&gt;</td>
</tr>
<tr>
<td>[Module: ] &lt;value&gt;</td>
</tr>
<tr>
<td>[SessionTV: ] &lt;value&gt;</td>
</tr>
</tbody>
</table>

Arguments

- **EventTV** - The time the event was detected.
- **Severity** - A relative severity of the security event.
  - Informational
  - Error
- **Service** - The Asterisk service that raised the security event.
- **EventVersion** - The version of this event.
- **AccountID** - The Service account associated with the security event notification.
- **SessionID** - A unique identifier for the session in the service that raised the event.
- **LocalAddress** - The address of the Asterisk service that raised the security event.
- **RemoteAddress** - The remote address of the entity that caused the security event to be raised.
- **Module** - If available, the name of the module that raised the event.
- **SessionTV** - The timestamp reported by the session.

Asterisk 14 ManagerEvent_MemoryLimit

MemoryLimit

Synopsis
Raised when a request fails due to an internal memory allocation failure.

Description

Syntax

```
Event: MemoryLimit
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
[Module: ] <value>
[SessionTV: ] <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Asterisk 14 ManagerEvent_MiniVoiceMail

MiniVoiceMail

Synopsis

Raised when a notification is sent out by a MiniVoiceMail application

Description

Syntax

```
Event: MiniVoiceMail
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
Action: <value>
Mailbox: <value>
Counter: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- **CallerIDNum**
- **CallerIDName**
- **ConnectedLineNum**
- **ConnectedLineName**
- **AccountCode**
- **Context**
- **Exten**
- **Priority**
- **Uniqueid**
- **Linkedid** - Uniqueid of the oldest channel associated with this channel.
- **Action** - What action was taken. Currently, this will always be SentNotification
- **Mailbox** - The mailbox that the notification was about, specified as mailbox@context
- **Counter** - A message counter derived from the MVM_COUNTER channel variable.

Asterisk 14 Manager Event_Pickup

Pickup

Synopsis
Raised when a call pickup occurs.

Description

Syntax

```
Event: Pickup
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
LinkedId: <value>
TargetChannel: <value>
TargetChannelState: <value>
TargetChannelStateDesc: <value>
TargetCallerIDNum: <value>
TargetCallerIDName: <value>
TargetConnectedLineNum: <value>
TargetConnectedLineName: <value>
TargetAccountCode: <value>
TargetContext: <value>
TargetExten: <value>
TargetPriority: <value>
TargetUniqueid: <value>
TargetLinkedId: <value>
```

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- LinkedId - Uniqueid of the oldest channel associated with this channel.
- TargetChannel
- TargetChannelState - A numeric code for the channel's current state, related to TargetChannelStateDesc
- TargetChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing
- Ring
- Ringing
- Up
- Busy
- Dialing Offhook
- Pre-ring
- Unknown
- TargetCallerIDNum
- TargetCallerIDName
- TargetConnectedLineNum
- TargetConnectedLineName
- TargetAccountCode
- TargetContext
- TargetExten
- TargetPriority
- TargetUniqueid
- TargetLinkedid - Uniqueid of the oldest channel associated with this channel.

Asterisk 14 ManagerEvent_PresenceStateChange

PresenceStateChange

Synopsis
Raised when a presence state changes

Description
This differs from the PresenceStatus event because this event is raised for all presence state changes, not only for changes that affect dialplan hints.

Syntax

```
Event: PresenceStateChange
Presentity: <value>
Status: <value>
Subtype: <value>
Message: <value>
```

Arguments
- **Presentity** - The entity whose presence state has changed
- **Status** - The new status of the presentity
- **Subtype** - The new subtype of the presentity
- **Message** - The new message of the presentity

Class

Asterisk 14 ManagerEvent_PresenceStateListComplete

PresenceStateListComplete

Synopsis

Indicates the end of the list the current known extension states.

Description

Syntax

```
Event: PresenceStateListComplete
EventList: <value>
ListItems: <value>
```

Arguments

- **EventList** - Conveys the status of the event list.
- **ListItems** - Conveys the number of statuses reported.

Asterisk 14 ManagerEvent_PresenceStatus

PresenceStatus

Synopsis

Raised when a hint changes due to a presence state change.

Description

Syntax

```
Event: PresenceStatus
  Exten: <value>
  Context: <value>
  Hint: <value>
  Status: <value>
  Subtype: <value>
  Message: <value>
```

Arguments

- Exten
- Context
- Hint
- Status
- Subtype
- Message

Asterisk 14 Manager Event QueueCallerAbandon

QueueCallerAbandon

Synopsis

Raised when a caller abandons the queue.

Description

Syntax

```
Event: QueueCallerAbandon
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
Queue: <value>
Position: <value>
OriginalPosition: <value>
HoldTime: <value>
```

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- Linkedid - Uniqueid of the oldest channel associated with this channel.
- Queue - The name of the queue.
- Position - This channel's current position in the queue.
- OriginalPosition - The channel's original position in the queue.
- HoldTime - The time the channel was in the queue, expressed in seconds since 00:00, Jan 1, 1970 UTC.

Asterisk 14 ManagerEvent_QueueCallerJoin

QueueCallerJoin

Synopsis
Raised when a caller joins a Queue.

Description

Syntax

```
Event: QueueCallerJoin
  Channel: <value>
  ChannelState: <value>
  ChannelStateDesc: <value>
  CallerIDNum: <value>
  CallerIDName: <value>
  ConnectedLineNum: <value>
  ConnectedLineName: <value>
  AccountCode: <value>
  Context: <value>
  Exten: <value>
  Priority: <value>
  Uniqueid: <value>
  Linkedid: <value>
  Queue: <value>
  Position: <value>
  Count: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring

Asterisk 14 ManagerEvent_QueueMemberAdded

QueueMemberAdded

Synopsis
Raised when a member is added to the queue.

Description

Syntax

```
Event: QueueMemberAdded
Queue: <value>
MemberName: <value>
Interface: <value>
StateInterface: <value>
Membership: <value>
Penalty: <value>
CallsTaken: <value>
LastCall: <value>
LastPause: <value>
InCall: <value>
Status: <value>
Paused: <value>
PausedReason: <value>
Ringinuse: <value>
```

Arguments

- **Queue** - The name of the queue.
- **MemberName** - The name of the queue member.
- **Interface** - The queue member's channel technology or location.
- **StateInterface** - Channel technology or location from which to read device state changes.
- **Membership**
  - dynamic
  - realtime
  - static
- **Penalty** - The penalty associated with the queue member.
- **CallsTaken** - The number of calls this queue member has serviced.
- **LastCall** - The time this member last took a call, expressed in seconds since 00:00, Jan 1, 1970 UTC.
- **LastPause** - The time when started last paused the queue member.
- **InCall** - Set to 1 if member is in call. Set to 0 after LastCall time is updated.
  - 0
  - 1
- **Status** - The numeric device state status of the queue member.
  - 0 - AST DEVICE UNKNOWN
  - 1 - AST DEVICE NOT_INUSE
  - 2 - AST DEVICE INUSE
  - 3 - AST DEVICE_BUSY
  - 4 - AST DEVICE INVALID
  - 5 - AST DEVICE_UNAVAILABLE
  - 6 - AST DEVICE_RINGING
  - 7 - AST DEVICE_RINGINUSE
  - 8 - AST DEVICE_ONHOLD
- **Paused**
  - 0
  - 1
- **PausedReason** - If set when paused, the reason the queue member was paused.
- **Ringinuse**
  - 0
  - 1

Asterisk 14 ManagerEvent_QueueMemberPause

QueueMemberPause

Synopsis
Raised when a member is paused/unpaused in the queue.

Description

Syntax

```
Event: QueueMemberPause
Queue: <value>
MemberName: <value>
Interface: <value>
StateInterface: <value>
Membership: <value>
Penalty: <value>
CallsTaken: <value>
LastCall: <value>
LastPause: <value>
InCall: <value>
Status: <value>
Paused: <value>
PausedReason: <value>
Ringinuse: <value>
Reason: <value>
```

Arguments

- **Queue** - The name of the queue.
- **MemberName** - The name of the queue member.
- **Interface** - The queue member's channel technology or location.
- **StateInterface** - Channel technology or location from which to read device state changes.
- **Membership**
  - dynamic
  - realtime
  - static
- **Penalty** - The penalty associated with the queue member.
- **CallsTaken** - The number of calls this queue member has serviced.
- **LastCall** - The time this member last took a call, expressed in seconds since 00:00, Jan 1, 1970 UTC.
- **LastPause** - The time when started last paused the queue member.

Event_QueueMemberPenalty

QueueMemberPenalty

Synopsis

Raised when a member's penalty is changed.

Description

Syntax

```
Event: QueueMemberPenalty
    Queue: <value>
    MemberName: <value>
    Interface: <value>
    StateInterface: <value>
    Membership: <value>
    Penalty: <value>
    CallsTaken: <value>
    LastCall: <value>
    LastPause: <value>
    InCall: <value>
    Status: <value>
    Paused: <value>
    PausedReason: <value>
    Ringinuse: <value>
```

Arguments

- **Queue** - The name of the queue.
- **MemberName** - The name of the queue member.
- **Interface** - The queue member's channel technology or location.
- **StateInterface** - Channel technology or location from which to read device state changes.
- **Membership**
  - dynamic

Event_QueueMemberRemoved

QueueMemberRemoved

Synopsis

Raised when a member is removed from the queue.

Description

Syntax

```plaintext
Event: QueueMemberRemoved
Queue: <value>
MemberName: <value>
Interface: <value>
StateInterface: <value>
Membership: <value>
Penalty: <value>
CallsTaken: <value>
LastCall: <value>
LastPause: <value>
InCall: <value>
Status: <value>
Paused: <value>
PausedReason: <value>
Ringinuse: <value>
```

Arguments

- **Queue** - The name of the queue.
- **MemberName** - The name of the queue member.
- **Interface** - The queue member's channel technology or location.
- **StateInterface** - Channel technology or location from which to read device state changes.
- **Membership**
  - dynamic
  - realtime
  - static
- **Penalty** - The penalty associated with the queue member.
- **CallsTaken** - The number of calls this queue member has serviced.
- **LastCall** - The time this member last took a call, expressed in seconds since 00:00, Jan 1, 1970 UTC.
- **LastPause** - The time when started last paused the queue member.
- **InCall** - Set to 1 if member is in call. Set to 0 after LastCall time is updated.
  - 0
  - 1
- **Status** - The numeric device state status of the queue member.
  - 0 - AST_DEVICE_UNKNOWN

Event_QueueMemberRinginuse

QueueMemberRinginuse

Synopsis
Raised when a member's ringinuse setting is changed.

Description

Syntax

```
Event: QueueMemberRinginuse
Queue: <value>
MemberName: <value>
Interface: <value>
StateInterface: <value>
Membership: <value>
Penalty: <value>
CallsTaken: <value>
LastCall: <value>
LastPause: <value>
InCall: <value>
Status: <value>
Paused: <value>
PausedReason: <value>
Ringinuse: <value>
```

Arguments

- **Queue** - The name of the queue.
- **MemberName** - The name of the queue member.
- **Interface** - The queue member's channel technology or location.
- **StateInterface** - Channel technology or location from which to read device state changes.
- **Membership**

**Event_Reload**

**Reload**

**Synopsis**

Raised when a module has been reloaded in Asterisk.

**Description**

**Syntax**

```
Event: Reload
Module: <value>
Status: <value>
```

**Arguments**

- **Module** - The name of the module that was reloaded, or All if all modules were reloaded
- **Status** - The numeric status code denoting the success or failure of the reload request.
  - 0 - Success
  - 1 - Request queued
  - 2 - Module not found
  - 3 - Error
  - 4 - Reload already in progress
  - 5 - Module uninitialized
  - 6 - Reload not supported

Asterisk 14 Manager Event_RequestBadFormat

RequestBadFormat

Synopsis
Raised when a request is received with bad formatting.

Description

Syntax

```
Event: RequestBadFormat
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
RequestType: <value>
[Module:]: <value>
[SessionTV:]: <value>
[AccountID:]: <value>
[RequestParams:]: <value>
```

Arguments

- **EventTV** - The time the event was detected.
- **Severity** - A relative severity of the security event.
  - **Informational**
  - **Error**
- **Service** - The Asterisk service that raised the security event.
- **EventVersion** - The version of this event.
- **AccountID** - The Service account associated with the security event notification.
- **SessionID** - A unique identifier for the session in the service that raised the event.
- **LocalAddress** - The address of the Asterisk service that raised the security event.
- **RemoteAddress** - The remote address of the entity that caused the security event to be raised.
- **RequestType** - The type of request attempted.
- **Module** - If available, the name of the module that raised the event.
- **SessionTV** - The timestamp reported by the session.
- **AccountID** - The account ID associated with the rejected request.
- **RequestParams** - Parameters provided to the rejected request.

Event_RequestNotAllowed

RequestNotAllowed

Synopsis

Raised when a request is not allowed by the service.

Description

Syntax

```
Event: RequestNotAllowed
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
RequestType: <value>
[Module: ] <value>
[SessionTV: ] <value>
[RequestParams: ] <value>
```

Arguments

- **EventTV** - The time the event was detected.
- **Severity** - A relative severity of the security event.
  - **Informational**
  - **Error**
- **Service** - The Asterisk service that raised the security event.
- **EventVersion** - The version of this event.
- **AccountID** - The Service account associated with the security event notification.
- **SessionID** - A unique identifier for the session in the service that raised the event.
- **LocalAddress** - The address of the Asterisk service that raised the security event.
- **RemoteAddress** - The remote address of the entity that caused the security event to be raised.
- **RequestType** - The type of request attempted.
- **Module** - If available, the name of the module that raised the event.
- **SessionTV** - The timestamp reported by the session.
- **RequestParams** - Parameters provided to the rejected request.

Asterisk 14 Manager Event_RequestNotSupported

RequestNotSupported

Synopsis

Raised when a request fails due to some aspect of the requested item not being supported by the service.

Description

Syntax

```
Event: RequestNotSupported
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
RequestType: <value>
[Module:]: <value>
[SessionTV:]: <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- RequestType - The type of request attempted.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Asterisk 14 Manager Event RTCPReceived

RTCPReceived

Synopsis
Raised when an RTCP packet is received.

Description

Syntax

```
Event: RTCPReceived
   Channel: <value>
   ChannelState: <value>
   ChannelStateDesc: <value>
   CallerIDNum: <value>
   CallerIDName: <value>
   ConnectedLineNum: <value>
   ConnectedLineName: <value>
   AccountCode: <value>
   Context: <value>
   Exten: <value>
   Priority: <value>
   Uniquid: <value>
   Linkedid: <value>
   SSRC: <value>
   PT: <value>
   From: <value>
   RTT: <value>
   ReportCount: <value>
   [SentNTP:] <value>
   [SentRTCP:] <value>
   [SentPackets:] <value>
   [SentOctets:] <value>
   ReportXSourceSSRC: <value>
   ReportXFractionLost: <value>
   ReportXCumulativeLost: <value>
   ReportXHighestSequence: <value>
   ReportXSequenceNumberCycles: <value>
   ReportXiJitter: <value>
   ReportXLSR: <value>
   ReportXDLSR: <value>
```

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniquid
- Linkedid - Uniqueid of the oldest channel associated with this channel.
- SSRC - The SSRC identifier for the remote system
- PT - The type of packet for this RTCP report.
  - 200 (SR)
  - 201 (RR)
- **From** - The address the report was received from.
- **RTT** - Calculated Round-Trip Time in seconds
- **ReportCount** - The number of reports that were received.
  The report count determines the number of ReportX headers in the message. The X for each set of report headers will range from 0 to \( \text{ReportCount} - 1 \).
- **SentNTP** - The time the sender generated the report. Only valid when PT is 200(SR).
- **SentRTP** - The sender's last RTP timestamp. Only valid when PT is 200(SR).
- **SentPackets** - The number of packets the sender has sent. Only valid when PT is 200(SR).
- **SentOctets** - The number of bytes the sender has sent. Only valid when PT is 200(SR).
- **ReportXSourceSSRC** - The SSRC for the source of this report block.
- **ReportXFractionLost** - The fraction of RTP data packets from \( \text{ReportXSourceSSRC} \) lost since the previous SR or RR report was sent.
- **ReportXCumulativeLost** - The total number of RTP data packets from \( \text{ReportXSourceSSRC} \) lost since the beginning of reception.
- **ReportXHighestSequence** - The highest sequence number received in an RTP data packet from \( \text{ReportXSourceSSRC} \).
- **ReportXSequenceNumberCycles** - The number of sequence number cycles seen for the RTP data received from \( \text{ReportXSourceSSRC} \).
- **ReportXIAJitter** - An estimate of the statistical variance of the RTP data packet interarrival time, measured in timestamp units.
- **ReportXLSR** - The last SR timestamp received from \( \text{ReportXSourceSSRC} \). If no SR has been received from \( \text{ReportXSourceSSRC} \), then 0.
- **ReportXDLSR** - The delay, expressed in units of \( \frac{1}{65536} \) seconds, between receiving the last SR packet from \( \text{ReportXSourceSSRC} \) and sending this report.

ReportXCumulativeLost: <value>
ReportXHighestSequence: <value>
ReportXSequenceNumberCycles: <value>
ReportXIAJitter: <value>
ReportXLSR: <value>
ReportXDLSR: <value>

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- Linkedid - Uniqueid of the oldest channel associated with this channel.
- SSRC - The SSRC identifier for our stream
- PT - The type of packet for this RTCP report.
  - 200 (SR)
  - 201 (RR)
- To - The address the report is sent to.
- **ReportCount** - The number of reports that were sent. The report count determines the number of ReportX headers in the message. The X for each set of report headers will range from 0 to ReportCount - 1.
- **SentNTP** - The time the sender generated the report. Only valid when PT is 200(SR).
- **SentRTP** - The sender's last RTP timestamp. Only valid when PT is 200(SR).
- **SentPackets** - The number of packets the sender has sent. Only valid when PT is 200(SR).
- **SentOctets** - The number of bytes the sender has sent. Only valid when PT is 200(SR).
- **ReportXSourceSSRC** - The SSRC for the source of this report block.
- **ReportXFractionLost** - The fraction of RTP data packets from ReportXSourceSSRC lost since the previous SR or RR report was sent.
- **ReportXCumulativeLost** - The total number of RTP data packets from ReportXSourceSSRC lost since the beginning of reception.
- **ReportXHighestSequence** - The highest sequence number received in an RTP data packet from ReportXSourceSSRC.
- **ReportXSequenceNumberCycles** - The number of sequence number cycles seen for the RTP data received from ReportXSourceSSRC.
- **ReportXIAJitter** - An estimate of the statistical variance of the RTP data packet interarrival time, measured in timestamp units.
- **ReportXLSR** - The last SR timestamp received from ReportXSourceSSRC. If no SR has been received from ReportXSourceSSRC, then 0.
- **ReportXDLSR** - The delay, expressed in units of 1/65536 seconds, between receiving the last SR packet from ReportXSourceSSRC and sending this report.

Event_SessionLimit

SessionLimit

Synopsis
Raised when a request fails due to exceeding the number of allowed concurrent sessions for that service.

Description

Syntax

```
Event: SessionLimit
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
[Module: ] <value>
[SessionTV: ] <value>
```

Arguments

- **EventTV** - The time the event was detected.
- **Severity** - A relative severity of the security event.
  - **Informational**
  - **Error**
- **Service** - The Asterisk service that raised the security event.
- **EventVersion** - The version of this event.
- **AccountID** - The Service account associated with the security event notification.
- **SessionID** - A unique identifier for the session in the service that raised the event.
- **LocalAddress** - The address of the Asterisk service that raised the security event.
- **RemoteAddress** - The remote address of the entity that caused the security event to be raised.
- **Module** - If available, the name of the module that raised the event.
- **SessionTV** - The timestamp reported by the session.

Event_SessionTimeout

SessionTimeout

Synopsis

Raised when a SIP session times out.

Description

Syntax

```
Event: SessionTimeout
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
Source: <value>
```

Arguments

- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- Linkedid - Uniqueid of the oldest channel associated with this channel.
- Source - The source of the session timeout.
  - RTPTimeout
  - SIPSessionTimer

Event_Shutdown

Shutdown

Synopsis

Raised when Asterisk is shutdown or restarted.

Description

Syntax

```
Event: Shutdown
Shutdown: <value>
Restart: <value>
```

Arguments

- **Shutdown** - Whether the shutdown is proceeding cleanly (all channels were hungup successfully) or uncleanly (channels will be terminated)
  - Uncleanly
  - Cleanly
- **Restart** - Whether or not a restart will occur.
  - True
  - False

  Application: <value>
  Data: <value>
  Nativeformats: <value>
  Readformat: <value>
  Readtrans: <value>
  Writeformat: <value>
  Writetrans: <value>
  Callgroup: <value>
  Pickupgroup: <value>
  Seconds: <value>
```

Arguments

- ActionID
- Channel
- ChannelState - A numeric code for the channel's current state, related to ChannelStateDesc
- ChannelStateDesc
  - Down
  - Rsvrd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- CallerIDNum
- CallerIDName
- ConnectedLineNum
- ConnectedLineName
- AccountCode
- Context
- Exten
- Priority
- Uniqueid
- Linkedid - Uniqueid of the oldest channel associated with this channel.
- Type - Type of channel
- DNID - Dialed number identifier
- TimeToHangup - Absolute lifetime of the channel
- BridgeID - Identifier of the bridge the channel is in, may be empty if not in one
- **Linkedid**
- **Application** - Application currently executing on the channel
- **Data** - Data given to the currently executing channel
- **Nativeformats** - Media formats the connected party is willing to send or receive
- **Readformat** - Media formats that frames from the channel are received in
- **Readtrans** - Translation path for media received in native formats
- **Writeformat** - Media formats that frames to the channel are accepted in
- **Writetrans** - Translation path for media sent to the connected party
- **Callgroup** - Configured call group on the channel
- **Pickupgroup** - Configured pickup group on the channel
- **Seconds** - Number of seconds the channel has been active

<td>UsingPassword: &lt;value&gt;</td>
</tr>
<tr>
<td>[Module:]: &lt;value&gt;</td>
</tr>
<tr>
<td>[SessionTV:]: &lt;value&gt;</td>
</tr>
</tbody>
</table>

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- UsingPassword - Whether or not the authentication attempt included a password.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Asterisk 14 ManagerEvent_TransportDetail

TransportDetail

Synopsis

Provide details about an authentication section.

Description

Syntax

```
Event: TransportDetail
  ObjectType: <value>
  ObjectName: <value>
  Protocol: <value>
  Bind: <value>
  AsyncOperations: <value>
  CaListFile: <value>
  CaListPath: <value>
  CertFile: <value>
  PrivKeyFile: <value>
  Password: <value>
  ExternalSignalingAddress: <value>
  ExternalSignalingPort: <value>
  ExternalMediaAddress: <value>
  Domain: <value>
  VerifyServer: <value>
  VerifyClient: <value>
  RequireClientCert: <value>
  Method: <value>
  Cipher: <value>
  LocalNet: <value>
  Tos: <value>
  Cos: <value>
  WebsocketWriteTimeout: <value>
  EndpointName: <value>
```

Arguments

- **ObjectType** - The object's type. This will always be 'transport'.
- **ObjectName** - The name of this object.
- **Protocol** - Protocol to use for SIP traffic
- **Bind** - IP Address and optional port to bind to for this transport
- **AsyncOperations** - Number of simultaneous Asynchronous Operations
- **CaListFile** - File containing a list of certificates to read (TLS ONLY)
- **CaListPath** - Path to directory containing a list of certificates to read (TLS ONLY)
- **CertFile** - Certificate file for endpoint (TLS ONLY)
- **PrivKeyFile** - Private key file (TLS ONLY)
- **Password** - Password required for transport
- **ExternalSignalingAddress** - External address for SIP signalling
- **ExternalSignalingPort** - External port for SIP signalling
- **ExternalMediaAddress** - External IP address to use in RTP handling
- **Domain** - Domain the transport comes from
- **VerifyServer** - Require verification of server certificate (TLS ONLY)
- **VerifyClient** - Require verification of client certificate (TLS ONLY)
- **RequireClientCert** - Require client certificate (TLS ONLY)
- **Method** - Method of SSL transport (TLS ONLY)
- **Cipher** - Preferred cryptography cipher names (TLS ONLY)
- **LocalNet** - Network to consider local (used for NAT purposes).
- **Tos** - Enable TOS for the signalling sent over this transport
- **Cos** - Enable COS for the signalling sent over this transport
- **WebsocketWriteTimeout** - The timeout (in milliseconds) to set on WebSocket connections.
- **EndpointName** - The name of the endpoint associated with this information.

Event_UnexpectedAddress

UnexpectedAddress

Synopsis

Raised when a request has a different source address then what is expected for a session already in progress with a service.

Description

Syntax

```
Event: UnexpectedAddress
EventTV: <value>
Severity: <value>
Service: <value>
EventVersion: <value>
AccountID: <value>
SessionID: <value>
LocalAddress: <value>
RemoteAddress: <value>
ExpectedAddress: <value>
[Module: ] <value>
[SessionTV: ] <value>
```

Arguments

- EventTV - The time the event was detected.
- Severity - A relative severity of the security event.
  - Informational
  - Error
- Service - The Asterisk service that raised the security event.
- EventVersion - The version of this event.
- AccountID - The Service account associated with the security event notification.
- SessionID - A unique identifier for the session in the service that raised the event.
- LocalAddress - The address of the Asterisk service that raised the security event.
- RemoteAddress - The remote address of the entity that caused the security event to be raised.
- ExpectedAddress - The address that the request was expected to use.
- Module - If available, the name of the module that raised the event.
- SessionTV - The timestamp reported by the session.

Asterisk 14 ManagerEvent_Unhold

Unhold

Synopsis

Raised when a channel goes off hold.

Description

Syntax

```
Event: Unhold
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
UniqueId: <value>
Linkedid: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- **CallerIDNum**
- **CallerIDName**

Asterisk 14 Manager Event_UnParkedCall

UnParkedCall

Synopsis
Raised when a channel leaves a parking lot because it was retrieved from the parking lot and reconnected.

Description

Syntax

Event: UnParkedCall
ParkeeChannel: <value>
ParkeeChannelState: <value>
ParkeeChannelStateDesc: <value>
ParkeeCallerIDNum: <value>
ParkeeCallerIDName: <value>
ParkeeConnectedLineNum: <value>
ParkeeConnectedLineName: <value>
ParkeeAccountCode: <value>
ParkeeContext: <value>
ParkeeExten: <value>
ParkeePriority: <value>
ParkeeUniquedid: <value>
ParkeeLinkedid: <value>
ParkeeDialString: <value>
Parkinglot: <value>
ParkingSpace: <value>
ParkingTimeout: <value>
ParkingDuration: <value>
RetrieverChannel: <value>
RetrieverChannelState: <value>
RetrieverChannelStateDesc: <value>
RetrieverCallerIDNum: <value>
RetrieverCallerIDName: <value>
RetrieverConnectedLineNum: <value>
RetrieverConnectedLineName: <value>
RetrieverAccountCode: <value>
RetrieverContext: <value>
RetrieverExten: <value>
RetrieverPriority: <value>
RetrieverUniquedid: <value>
RetrieverLinkedid: <value>

Arguments

- ParkeeChannel
- ParkeeChannelState - A numeric code for the channel's current state, related to ParkeeChannelStateDesc
- ParkeeChannelStateDesc
  - Down
  - Rsvrd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy
  - Dialing Offhook
  - Pre-ring
  - Unknown
- ParkeeCallerIDNum
- ParkeeCallerIDName

Asterisk 14 ManagerEvent_UserEvent

UserEvent

Synopsis

A user defined event raised from the dialplan.

Description

Event may contain additional arbitrary parameters in addition to optional bridge and endpoint snapshots. Multiple snapshots of the same type are prefixed with a numeric value.

Syntax

```
Event: UserEvent
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
UserEvent: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring

Asterisk 14 ManagerEvent_VarSet

VarSet

Synopsis

Raised when a variable local to the gosub stack frame is set due to a subroutine call.

Description

Syntax

```plaintext
Event: VarSet
Channel: <value>
ChannelState: <value>
ChannelStateDesc: <value>
CallerIDNum: <value>
CallerIDName: <value>
ConnectedLineNum: <value>
ConnectedLineName: <value>
AccountCode: <value>
Context: <value>
Exten: <value>
Priority: <value>
Uniqueid: <value>
Linkedid: <value>
Variable: <value>
Value: <value>
```

Arguments

- **Channel**
- **ChannelState** - A numeric code for the channel's current state, related to ChannelStateDesc
- **ChannelStateDesc**
  - Down
  - Rsrvd
  - OffHook
  - Dialing
  - Ring
  - Ringing
  - Up
  - Busy

Asterisk 14 Application_AddQueueMember

AddQueueMember()

Synopsis
Dynamically adds queue members.

Description
Dynamically adds interface to an existing queue. If the interface is already in the queue it will return an error.

This application sets the following channel variable upon completion:

- **AQMSTATUS** - The status of the attempt to add a queue member as a text string.
  - **ADDED**
  - **MEMBERALREADY**
  - **NOSUCHQUEUE**

Syntax

```
AddQueueMember(queuename, [interface, [penalty, [options, [membername, [stateinterface]]]]])
```

Arguments

- **queuename**
- **interface**
- **penalty**
- **options**
- **membername**
- **stateinterface**

Asterisk 14 Application_ADSIProg

ADSIProg()

Synopsis
Load Asterisk ADSI Scripts into phone

Description
This application programs an ADSI Phone with the given script

Syntax

```
ADSIProg({script})
```

Arguments
- script - adsi script to use. If not given uses the default script asterisk.adsi

See Also
- Asterisk 14 Application_GetCPEID
- adsi.conf

**Asterisk 14 Application_AELSub**

**AELSub()**

**Synopsis**
Launch subroutine built with AEL

**Description**
Execute the named subroutine, defined in AEL, from another dialplan language, such as extensions.conf, Realtime extensions, or Lua.
The purpose of this application is to provide a sane entry point into AEL subroutines, the implementation of which may change from time to time.

**Syntax**

```
AELSub(routine, [args])
```

**Arguments**
- **routine** - Named subroutine to execute.
- **args**

**See Also**

**Import Version**
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application.AgentLogin

AgentLogin()

Synopsis
Login an agent.

Description
Login an agent to the system. Any agent authentication is assumed to already be done by dialplan. While logged in, the agent can receive calls and will hear the sound file specified by the config option custom_beep when a new call comes in for the agent. Login failures will continue in the dialplan with AGENT_STATUS set.

Before logging in, you can setup on the real agent channel the CHANNEL(dtmf-features) an agent will have when talking to a caller and you can setup on the channel running this application the CONNECTEDLINE() information the agent will see while waiting for a caller.

AGENT_STATUS enumeration values:
- INVALID - The specified agent is invalid.
- ALREADY_LOGGED_IN - The agent is already logged in.

Syntax
AgentLogin(AgentId, [options])

Arguments
- AgentId
- options
  - s - silent login - do not announce the login ok segment after agent logged on.

Asterisk 14 Application_AgentRequest

AgentRequest()

Synopsis
Request an agent to connect with the channel.

Description
Request an agent to connect with the channel. Failure to find, alert the agent, or acknowledge the call will continue in the dialplan with AGENT_STATUS set. AGENT_STATUS enumeration values:

- INVALID - The specified agent is invalid.
- NOT_LOGGED_IN - The agent is not available.
- BUSY - The agent is on another call.
- NOT_CONNECTED - The agent did not connect with the call. The agent most likely did not acknowledge the call.
- ERROR - Alerting the agent failed.

Syntax
AgentRequest(AgentId)

Arguments
- AgentId

See Also
- Asterisk 14 Application_AgentLogin

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_AGI

AGI()

Synopsis

Executes an AGI compliant application.

Description

Executes an Asterisk Gateway Interface compliant program on a channel. AGI allows Asterisk to launch external programs written in any language to control a telephony channel, play audio, read DTMF digits, etc. by communicating with the AGI protocol on stdin and stdout. As of 1.6.0, this channel will not stop dialplan execution on hangup inside of this application. Dialplan execution will continue normally, even upon hangup until the AGI application signals a desire to stop (either by exiting or, in the case of a net script, by closing the connection). A locally executed AGI script will receive SIGHUP on hangup from the channel except when using DeadAGI. A fast AGI server will correspondingly receive a HANGUP inline with the command dialog. Both of these signals may be disabled by setting the AGISIGHUP channel variable to no before executing the AGI application. Alternatively, if you would like the AGI application to exit immediately after a channel hangup is detected, set the AGIEXITONHANGUP variable to yes.

Use the CLI command agi show commands to list available agi commands.

This application sets the following channel variable upon completion:

- AGISTATUS - The status of the attempt to run the AGI script text string, one of:
  - SUCCESS
  - FAILURE
  - NOTFOUND
  - HANGUP

Syntax

AGI(command, arg1, [arg2], ...)

Arguments

- command
- args
  - arg1
  - arg2

See Also

- Asterisk 14 Application_EAGI
- Asterisk 14 Application_DeadAGI

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_AlarmReceiver

AlarmReceiver()

Synopsis

Provide support for receiving alarm reports from a burglar or fire alarm panel.

Description

This application should be called whenever there is an alarm panel calling in to dump its events. The application will handshake with the alarm panel, and receive events, validate them, handshake them, and store them until the panel hangs up. Once the panel hangs up, the application will run the system command specified by the eventcmd setting in alarmreceiver.conf and pipe the events to the standard input of the application. The configuration file also contains settings for DTMF timing, and for the loudness of the acknowledgement tones.

Note

Few Ademco DTMF signalling formats are detected automatically: Contact ID, Express 4+1, Express 4+2, High Speed and Super Fast.

The application is affected by the following variables:

- ALARMRECEIVER_CALL_LIMIT: Maximum call time, in milliseconds.
  If set, this variable causes application to exit after the specified time.
- ALARMRECEIVER_RETRIES_LIMIT: Maximum number of retries per call.
  If set, this variable causes application to exit after the specified number of messages.

Syntax

```
AlarmReceiver()
```

Arguments

See Also

- alarmreceiver.conf

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_AMD

AMD()

Synopsis

Attempt to detect answering machines.

Description

This application attempts to detect answering machines at the beginning of outbound calls. Simply call this application after the call has been answered (outbound only, of course).

When loaded, AMD reads amd.conf and uses the parameters specified as default values. Those default values get overwritten when the calling AMD with parameters.

This application sets the following channel variables:

- **AMDSTATUS** - This is the status of the answering machine detection
  - MACHINE
  - HUMAN
  - NOTSURE
  - HANGUP
- **AMDCAUSE** - Indicates the cause that led to the conclusion
  - TOOLONG - Total Time.
  - INITIALSENCE - Silence Duration - Initial Silence.
  - HUMAN - Silence Duration - afterGreetingSilence.
  - LONGGREETING - Voice Duration - Greeting.
  - MAXWORDLENGTH - Word Length - max length of a single word.
  - MAXWORDS - Word Count - maximum number of words.

Syntax

```
AMD([initialSilence,[greeting,[afterGreetingSilence,[totalAnalysis
Time, [minimumWordLength, [betweenWordSilence, [maximumNumberOfWords, [silenceThreshold, [maximumWordLength]]]]]]]]])
```

Arguments

- **initialSilence** - Is maximum initial silence duration before greeting.
  
  If this is exceeded, the result is detection as a MACHINE
- **greeting** - is the maximum length of a greeting.
  
  If this is exceeded, the result is detection as a MACHINE
- **afterGreetingSilence** - Is the silence after detecting a greeting.
  
  If this is exceeded, the result is detection as a HUMAN
- **totalAnalysis Time** - Is the maximum time allowed for the algorithm to decide on whether the audio represents a HUMAN, or a MACHINE
- **minimumWordLength** - Is the minimum duration of Voice considered to be a word
- **betweenWordSilence** - Is the minimum duration of silence after a word to consider the audio that follows to be a new word
- **maximumNumberOfWords** - Is the maximum number of words in a greeting
  
  If this is exceeded, then the result is detection as a MACHINE
- **silenceThreshold** - What is the average level of noise from 0 to 32767 which if not exceeded, should be considered silence?
- **maximumWordLength** - Is the maximum duration of a word to accept.
  
  If exceeded, then the result is detection as a MACHINE

- Asterisk 14 Application_WaitForNoise

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Answer

Answer()

Synopsis
Answer a channel if ringing.

Description
If the call has not been answered, this application will answer it. Otherwise, it has no effect on the call.

Syntax

```
Answer([delay])
```

Arguments
- delay - Asterisk will wait this number of milliseconds before returning to the dialplan after answering the call.

See Also
- Asterisk 14 Application_Hangup

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Authenticate

Authenticate()

Synopsis

Authenticate a user

Description

This application asks the caller to enter a given password in order to continue dialplan execution.

If the password begins with the / character, it is interpreted as a file which contains a list of valid passwords, listed 1 password per line in the file.

When using a database key, the value associated with the key can be anything.

Users have three attempts to authenticate before the channel is hung up.

Syntax

Authenticate(password,[options,[maxdigits,[prompt]]])

Arguments

- **password**: Password the user should know
- **options**
  - a - Set the channels’ account code to the password that is entered
  - d - Interpret the given path as database key, not a literal file.
  - m - Interpret the given path as a file which contains a list of account codes and password hashes delimited with ;, listed one per line in the file. When one of the passwords is matched, the channel will have its account code set to the corresponding account code in the file.
  - r - Remove the database key upon successful entry (valid with d only)
- **maxdigits**: Maximum acceptable number of digits. Stops reading after maxdigits have been entered (without requiring the user to press the # key). Defaults to 0 - no limit - wait for the user press the # key.
- **prompt**: Override the agent-pass prompt file.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_BackGround

BackGround()

Synopsis

Play an audio file while waiting for digits of an extension to go to.

Description

This application will play the given list of files (do not put extension) while waiting for an extension to be dialed by the calling channel. To continue waiting for digits after this application has finished playing files, the WaitExten application should be used.

If one of the requested sound files does not exist, call processing will be terminated.

This application sets the following channel variable upon completion:

- **BACKGROUNDSTATUS** - The status of the background attempt as a text string.
  - SUCCESS
  - FAILED

Syntax

```
BackGround(filename1[filename2[&...]],[options,[langoverride,[context]]])
```

Arguments

- **filenames**
  - filename1
  - filename2
- **options**
  - s - Causes the playback of the message to be skipped if the channel is not in the up state (i.e. it hasn't been answered yet). If this happens, the application will return immediately.
  - n - Don't answer the channel before playing the files.
  - m - Only break if a digit hit matches a one digit extension in the destination context.
- **langoverride** - Explicitly specifies which language to attempt to use for the requested sound files.
- **context** - This is the dialplan context that this application will use when exiting to a dialed extension.

See Also

- Asterisk 14 Application_ControlPlayback
- Asterisk 14 Application_WaitExten
- Asterisk 14 Application_BackgroundDetect
- Asterisk 14 Function_TIMEOUT

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_BackgroundDetect

BackgroundDetect()

Synopsis

Background a file with talk detect.

Description

Plays back filename, waiting for interruption from a given digit (the digit must start the beginning of a valid extension, or it will be ignored). During the playback of the file, audio is monitored in the receive direction, and if a period of non-silence which is greater than min ms yet less than max ms is followed by silence for at least sil ms, which occurs during the first analysistime ms, then the audio playback is aborted and processing jumps to the talk extension, if available.

Syntax

\texttt{BackgroundDetect(filename, [sil, [min, [max, [analysistime]]]])}

Arguments

- filename
- sil - If not specified, defaults to 1000.
- min - If not specified, defaults to 100.
- max - If not specified, defaults to infinity.
- analysistime - If not specified, defaults to infinity.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Bridge

Bridge()

Synopsis
Bridge two channels.

Description
Allows the ability to bridge two channels via the dialplan.

This application sets the following channel variable upon completion:

- **BRIDGERESULT**: The result of the bridge attempt as a text string.
  - SUCCESS
  - FAILURE
  - LOOP
  - NONEXISTENT
  - INCOMPATIBLE

Syntax

```
Bridge(channel, [options])
```

Arguments

- **channel** - The current channel is bridged to the specified channel.
- **options**
  - **p** - Play a courtesy tone to channel.
  - **F** - When the bridger hangs up, transfer the bridged party to the specified destination and start execution at that location.
    - **context**
    - **exten**
    - **priority**
  - **f** - When the bridger hangs up, transfer the bridged party to the next priority of the current extension and start execution at that location.
  - **h** - Allow the called party to hang up by sending the * DTMF digit.
  - **H** - Allow the calling party to hang up by pressing the * DTMF digit.
  - **k** - Allow the called party to enable parking of the call by sending the DTMF sequence defined for call parking in `features.conf`.
  - **K** - Allow the calling party to enable parking of the call by sending the DTMF sequence defined for call parking in `features.conf`.
  - **l(xyz)** - Limit the call to x ms. Play a warning when y ms are left. Repeat the warning every z ms. The following special variables can be used with this option:
    - **LIMIT_PLAYAUDIO_CALLER** - Play sounds to the caller. yes|no (default yes)
    - **LIMIT_PLAYAUDIO_CALEE** - Play sounds to the callee. yes|no
    - **LIMIT_TIMEOUT_FILE** - File to play when time is up.
    - **LIMIT_CONNECT_FILE** - File to play when call begins.
    - **LIMIT_WARNING_FILE** - File to play as warning if y is defined. The default is to say the time remaining.
  - **s** - Hang up the call after x seconds after the called party has answered the call.
  - **t** - Allow the called party to transfer the calling party by sending the DTMF sequence defined in `features.conf`.
  - **T** - Allow the calling party to transfer the called party by sending the DTMF sequence defined in `features.conf`.
  - **w** - Allow the called party to enable recording of the call by sending the DTMF sequence defined for one-touch recording in `features.conf`.
  - **W** - Allow the calling party to enable recording of the call by sending the DTMF sequence defined for one-touch recording in `features.conf`.
  - **x** - Cause the called party to be hung up after the bridge, instead of being restarted in the dialplan.

Asterisk 14 Application_BridgeAdd

BridgeAdd()

Synopsis

Join a bridge that contains the specified channel.

Description

This application places the incoming channel into the bridge containing the specified channel. The specified channel only needs to be the prefix of a full channel name IE. 'SIP/cisco0001'.

Syntax

BridgeAdd([name])

Arguments

- name - Name of the channel in an existing bridge

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_BridgeWait

BridgeWait()

Synopsis
Put a call into the holding bridge.

Description
This application places the incoming channel into a holding bridge. The channel will then wait in the holding bridge until some event occurs which removes it from the holding bridge.

Note
This application will answer calls which haven't already been answered.

Syntax

BridgeWait({name,[role,[options]]})

Arguments
- **name** - Name of the holding bridge to join. This is a handle for BridgeWait only and does not affect the actual bridges that are created. If not provided, the reserved name default will be used.
- **role** - Defines the channel's purpose for entering the holding bridge. Values are case sensitive.
  - **participant** - The channel will enter the holding bridge to be placed on hold until it is removed from the bridge for some reason. (default)
  - **announcer** - The channel will enter the holding bridge to make announcements to channels that are currently in the holding bridge. While an announcer is present, holding for the participants will be suspended.
- **options**
  - **m** - The specified MOH class will be used/suggested for music on hold operations. This option will only be useful for entertainment modes that use it (m and h).
    - **class**
  - **e** - Which entertainment mechanism should be used while on hold in the holding bridge. Only the first letter is read.
    - **m** - Play music on hold (default)
    - **r** - Ring without pause
    - **s** - Generate silent audio
    - **h** - Put the channel on hold
    - **n** - No entertainment
  - **s** - Automatically exit the bridge and return to the PBX after duration seconds.
    - **duration**

Asterisk 14 Application_Busy

Busy()

Synopsis

Indicate the Busy condition.

Description

This application will indicate the busy condition to the calling channel.

Syntax

```
Busy([timeout])
```

Arguments

- `timeout` - If specified, the calling channel will be hung up after the specified number of seconds. Otherwise, this application will wait until the calling channel hangs up.

Asterisk 14 Application_CallCompletionCancel

CallCompletionCancel()

Synopsis
Cancel call completion service

Description
Cancel a Call Completion Request.

This application sets the following channel variables:

- **CC_CANCEL_RESULT** - This is the returned status of the cancel.
  - SUCCESS
  - FAIL
- **CC_CANCEL_REASON** - This is the reason the cancel failed.
  - NO_CORE_INSTANCE
  - NOT GENERIC
  - UNSPECIFIED

Syntax

```
CallCompletionCancel()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_CallCompletionRequest

CallCompletionRequest()

Synopsis
Request call completion service for previous call

Description
Request call completion service for a previously failed call attempt.
This application sets the following channel variables:

- **CC_REQUEST_RESULT** - This is the returned status of the request.
  - SUCCESS
  - FAIL
- **CC_REQUEST_REASON** - This is the reason the request failed.
  - NO_CORE_Instance
  - NOT_GENERIC
  - TOO_MANY_REQUESTS
  - UNSPECIFIED

Syntax

```
CallCompletionRequest()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_CELGenUserEvent

CELGенUserEvent()

Synopsis
Generates a CEL User Defined Event.

Description
A CEL event will be immediately generated by this channel, with the supplied name for a type.

Syntax

```
CELGенUserEvent(event-name,[extra])
```

Arguments

- `event-name`
- `extra` - Extra text to be included with the event.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ChangeMonitor

ChangeMonitor()

Synopsis
Change monitoring filename of a channel.

Description
Changes monitoring filename of a channel. Has no effect if the channel is not monitored.

Syntax

ChangeMonitor(filename_base)

Arguments

- filename_base - The new filename base to use for monitoring this channel.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ChansAvail

ChanlsAvail()

Synopsis
Check channel availability

Description
This application will check to see if any of the specified channels are available.

This application sets the following channel variables:

- AVAILCHAN - The name of the available channel, if one exists
- AVAILORIGCHAN - The canonical channel name that was used to create the channel
- AVAILSTATUS - The device state for the device
- AVAILCAUSECODE - The cause code returned when requesting the channel

Syntax

```
ChanlsAvail([[Technology2/Resource2[&...]],[options])
```

Arguments

- Technology/Resource - **Technology2/Resource2** - Optional extra devices to check
  If you need more than one enter them as Technology2/Resource2&Technology3/Resource3&.....
  Specification of the device(s) to check. These must be in the format of Technology/Resource, where Technology represents a particular channel driver, and Resource represents a resource available to that particular channel driver.
- options
  - a - Check for all available channels, not only the first one
  - s - Consider the channel unavailable if the channel is in use at all
  - t - Simply checks if specified channels exist in the channel list

Asterisk 14 Application_ChannelRedirect

ChannelRedirect()

Synopsis
Redirects given channel to a dialplan target

Description
Sends the specified channel to the specified extension priority
This application sets the following channel variables upon completion
- CHANNELREDIRECT_STATUS - Are set to the result of the redirection
  - NOCHANNEL
  - SUCCESS

Syntax
ChannelRedirect (channel, [context, [extension, ]]priority)

Arguments
- channel
- context
- extension
- priority

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ChanSpy

ChanSpy()

Synopsis

Listen to a channel, and optionally whisper into it.

Description

This application is used to listen to the audio from an Asterisk channel. This includes the audio coming in and out of the channel being spied on. If the chan prefix parameter is specified, only channels beginning with this string will be spied upon.

While spying, the following actions may be performed:

- **Dialing #** cycles the volume level.
- **Dialing *** will stop spying and look for another channel to spy on.
- **Dialing a series of digits followed by #** builds a channel name to append to chanprefix. For example, executing ChanSpy(Agent) and then dialing the digits '1234#' while spying will begin spying on the channel 'Agent/1234'. Note that this feature will be overridden if the 'd' or 'u' options are used.

**Note**
The X option supersedes the three features above in that if a valid single digit extension exists in the correct context ChanSpy will exit to it. This also disables choosing a channel based on chanprefix and a digit sequence.

Syntax

```
ChanSpy([chanprefix,[options]])
```

Arguments

- **chanprefix**
- **options**
  - b - Only spy on channels involved in a bridged call.
  - B - Instead of whispering on a single channel barge in on both channels involved in the call.
  - c
    - digit - Specify a DTMF digit that can be used to spy on the next available channel.
  - d - Override the typical numeric DTMF functionality and instead use DTMF to switch between spy modes.
    - 4 - spy mode
    - 5 - whisper mode
    - 6 - barge mode
  - e - Enable enforced mode, so the spying channel can only monitor extensions whose name is in the ext : delimited list.
    - ext
  - E - Exit when the spied-on channel hangs up.
  - g
    - grp - Only spy on channels in which one or more of the groups listed in grp matches one or more groups from the SPYG ROUP variable set on the channel to be spied upon.
  - I - Allow usage of a long queue to store audio frames.
  - n - Say the name of the person being spied on if that person has recorded his/her name. If a context is specified, then that voicemail context will be searched when retrieving the name, otherwise the default context is used when searching for the name (i.e. if SIP/1000 is the channel being spied on and no mailbox is specified, then 1000 will be used when searching for the name).
    - mailbox
      - context
  - o - Only listen to audio coming from this channel.
  - q - Don't play a beep when beginning to spy on a channel, or speak the selected channel name.
  - r - Record the session to the monitor spool directory. An optional base for the filename may be specified. The default is chansp y.
    - basename
  - s - Skip the playback of the channel type (i.e. SIP, IAX, etc) when speaking the selected channel name.
  - S - Stop when no more channels are left to spy on.
  - u - The chanprefix parameter is a channel uniqueid or fully specified channel name.
  - v - Adjust the initial volume in the range from -4 to 4. A negative value refers to a quieter setting.
- **w** - Enable whisper mode, so the spying channel can talk to the spied-on channel.
- **N** - Enable private whisper mode, so the spying channel can talk to the spied-on channel but cannot listen to that channel.
- **X** - Specify a DTMF digit that can be used to exit the application while actively spying on a channel. If there is no channel being spied on, the DTMF digit will be ignored.
- **X** - Allow the user to exit ChanSpy to a valid single digit numeric extension in the current context or the context specified by the `SPY_EXITCONTEXT` channel variable. The name of the last channel that was spied on will be stored in the `SPY_CHANNEL` variable.

Asterisk 14 Application_ClearHash

ClearHash()

Synopsis
Clear the keys from a specified hashname.

Description
Clears all keys out of the specified hashname.

Syntax

```
ClearHash(hashname)
```

Arguments

- `hashname`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ConfBridge

ConfBridge()

Synopsis
Conference bridge application.

Description
Enters the user into a specified conference bridge. The user can exit the conference by hangup or DTMF menu option.

This application sets the following channel variable upon completion:

- CONFBRIDGE_RESULT
  - FAILED - The channel encountered an error and could not enter the conference.
  - HANGUP - The channel exited the conference by hanging up.
  - KICKED - The channel was kicked from the conference.
  - ENDMARKED - The channel left the conference as a result of the last marked user leaving.
  - DTMF - The channel pressed a DTMF sequence to exit the conference.
  - TIMEOUT - The channel reached its configured timeout.

Syntax

ConfBridge(conference,[bridge_profile,[user_profile,[menu]]])

Arguments

- conference - Name of the conference bridge. You are not limited to just numbers.
- bridge_profile - The bridge profile name from confbridge.conf. When left blank, a dynamically built bridge profile created by the CONFBRIDGE dialplan function is searched for on the channel and used. If no dynamic profile is present, the 'default_bridge' profile found in confbridge.conf is used.
  It is important to note that while user profiles may be unique for each participant, mixing bridge profiles on a single conference is _NOT_ recommended and will produce undefined results.
- user_profile - The user profile name from confbridge.conf. When left blank, a dynamically built user profile created by the CONFBRIDGE dialplan function is searched for on the channel and used. If no dynamic profile is present, the 'default_user' profile found in confbridge.conf is used.
- menu - The name of the DTMF menu in confbridge.conf to be applied to this channel. When left blank, a dynamically built menu profile created by the CONFBRIDGE dialplan function is searched for on the channel and used. If no dynamic profile is present, the 'default_menu' profile found in confbridge.conf is used.

Asterisk 14 Application_Congestion

Congestion()

Synopsis

Indicate the Congestion condition.

Description

This application will indicate the congestion condition to the calling channel.

Syntax

```
Congestion([timeout])
```

Arguments

- `timeout` - If specified, the calling channel will be hung up after the specified number of seconds. Otherwise, this application will wait until the calling channel hangs up.

Asterisk 14 Application_ControlPlayback

ControlPlayback()

Synopsis

Play a file with fast forward and rewind.

Description

This application will play back the given filename.

It sets the following channel variables upon completion:

- **CPLAYBACKSTATUS** - Contains the status of the attempt as a text string
  - SUCCESS
  - USERSTOPPED
  - REMOTESTOPPED
  - ERROR
- **CPLAYBACKOFFSET** - Contains the offset in ms into the file where playback was at when it stopped. –1 is end of file.
- **CPLAYBACKSTOPKEY** - If the playback is stopped by the user this variable contains the key that was pressed.

Syntax

```
ControlPlayback(filename, [skipms, [ff, [rew, [stop, [pause, [restart, [options]]]]]]])
```

Arguments

- **filename**
- **skipms** - This is number of milliseconds to skip when rewinding or fast-forwarding.
- **ff** - Fast-forward when this DTMF digit is received. (defaults to #)
- **rew** - Rewind when this DTMF digit is received. (defaults to *)
- **stop** - Stop playback when this DTMF digit is received.
- **pause** - Pause playback when this DTMF digit is received.
- **restart** - Restart playback when this DTMF digit is received.
- **options**
  - **time** - Start at time ms from the beginning of the file.

Asterisk 14 Application_DAHDIAcceptR2Call

DAHDIAcceptR2Call()

Synopsis
Accept an R2 call if it's not already accepted (you still need to answer it)

Description
This application will Accept the R2 call either with charge or no charge.

Syntax

```
DAHDIAcceptR2Call(charge)
```

Arguments

- `charge` - Yes or No.
  Whether you want to accept the call with charge or without charge.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_DAHDIRAS

DAHDIRAS()

Synopsis
Executes DAHDI ISDN RAS application.

Description
Executes a RAS server using pppd on the given channel. The channel must be a clear channel (i.e. PRI source) and a DAHDI channel to be able to use this function (No modem emulation is included).
Your pppd must be patched to be DAHDI aware.

Syntax

```
DAHDIRAS(args)
```

Arguments

- `args` - A list of parameters to pass to the pppd daemon, separated by , characters.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_DAHDIScan

DAHDIScan()

Synopsis
Scan DAHDI channels to monitor calls.

Description
Allows a call center manager to monitor DAHDI channels in a convenient way. Use # to select the next channel and use * to exit.

Syntax

```
DAHDIScan([group])
```

Arguments

- **group** - Limit scanning to a channel *group* by setting this option.

Asterisk 14 Application_DAHDISendCallreroutingFacility

DAHDISendCallreroutingFacility()

Synopsis

Send an ISDN call rerouting/deflection facility message.

Description

This application will send an ISDN switch specific call rerouting/deflection facility message over the current channel. Supported switches depend upon the version of libpri in use.

Syntax

```
DAHDISendCallreroutingFacility(destination, [original, [reason]])
```

Arguments

- `destination` - Destination number.
- `original` - Original called number.
- `reason` - Diversion reason, if not specified defaults to unknown

Asterisk 14 Application_DAHDISendKeypadFacility

DAHDISendKeypadFacility()

Synopsis
Send digits out of band over a PRI.

Description
This application will send the given string of digits in a Keypad Facility IE over the current channel.

Syntax

```
DAHDISendKeypadFacility(digits)
```

Arguments

- `digits`

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_DateTime

DateTime()

Synopsis
Says a specified time in a custom format.

Description
Say the date and time in a specified format.

Syntax

```
DateTime([unixtime,[timezone,[format]]])
```

Arguments

- unixtime - time, in seconds since Jan 1, 1970. May be negative. Defaults to now.
- timezone - timezone, see `/usr/share/zoneinfo` for a list. Defaults to machine default.
- format - a format the time is to be said in. See `voicemail.conf`. Defaults to `ABdY "digits/at" IMp`

Asterisk 14 Application_DBdel

DBdel()

Synopsis
Delete a key from the asterisk database.

Description
This application will delete a key from the Asterisk database.

Note
This application has been DEPRECATED in favor of the DB_DELETE function.

Syntax

```
DBdel(family/key)
```

Arguments
- family
- key

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_DeadAGI

DeadAGI()

Synopsis

Executes AGI on a hungup channel.

Description

Executes an Asterisk Gateway Interface compliant program on a channel. AGI allows Asterisk to launch external programs written in any language to control a telephony channel, play audio, read DTMF digits, etc. by communicating with the AGI protocol on stdin and stdout. As of 1.6.0, this channel will not stop dialplan execution on hangup inside of this application. Dialplan execution will continue normally, even upon hangup until the AGI application signals a desire to stop (either by exiting or, in the case of a net script, by closing the connection). A locally executed AGI script will receive SIGHUP on hangup from the channel except when using DeadAGI. A fast AGI server will correspondingly receive a HANGUP inline with the command dialog. Both of these signals may be disabled by setting the AGISIGHUP channel variable to no before executing the AGI application. Alternatively, if you would like the AGI application to exit immediately after a channel hangup is detected, set the AGIEXITONHANGUP variable to yes.

Use the CLI command agi show commands to list available agi commands.

This application sets the following channel variable upon completion:

- AGISTATUS - The status of the attempt to run the AGI script text string, one of:
  - SUCCESS
  - FAILURE
  - NOTFOUND
  - HANGUP

Syntax

```
DeadAGI(command, arg1, [arg2, ...])
```

Arguments

- `command`
- `args`
  - `arg1`
  - `arg2`

See Also

- Asterisk 14 Application_AGI
- Asterisk 14 Application_EAGI

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Dial

Dial()

Synopsis

Attempt to connect to another device or endpoint and bridge the call.

Description

This application will place calls to one or more specified channels. As soon as one of the requested channels answers, the originating channel will be answered, if it has not already been answered. These two channels will then be active in a bridged call. All other channels that were requested will then be hung up.

Unless there is a timeout specified, the Dial application will wait indefinitely until one of the called channels answers, the user hangs up, or if all of the called channels are busy or unavailable. Dialplan execution will continue if no requested channels can be called, or if the timeout expires. This application will report normal termination if the originating channel hangs up, or if the call is bridged and either of the parties in the bridge ends the call.

If the OUTBOUND_GROUP variable is set, all peer channels created by this application will be put into that group (as in Set(GROUP()=...). If the OUTBOUND_GROUP_ONCE variable is set, all peer channels created by this application will be put into that group (as in Set(GROUP()=...). Unlike OUTBOUND_GROUP, however, the variable will be unset after use.

This application sets the following channel variables:

- **DIALEDTIME** - This is the time from dialing a channel until it is disconnected.
- **ANSWEREDTIME** - This is the amount of time for actual call.
- **DIALSTATUS** - This is the status of the call
  - CHANUNAVAIL
  - CONGESTION
  - NOANSWER
  - BUSY
  - ANSWER
  - CANCEL
  - DONTCALL - For the Privacy and Screening Modes. Will be set if the called party chooses to send the calling party to the 'Go Away' script.
  - TORTURE - For the Privacy and Screening Modes. Will be set if the called party chooses to send the calling party to the 'torture' script.
  - INVALIDARGS

Syntax

Dial[Technology/Resource|Technology2/Resource2|&...],[timeout,[options,[URL]]]

Arguments

- **Technology/Resource**
  - Specification of the device(s) to dial. These must be in the format of Technology/Resource, where Technology represents a particular channel driver, and Resource represents a resource available to that particular channel driver.
  - Technology2/Resource2 - Optional extra devices to dial in parallel
    - If you need more than one enter them as Technology2/Resource2&Technology3/Resource3&.....
- **timeout** - Specifies the number of seconds we attempt to dial the specified devices.
  - If not specified, this defaults to 136 years.
- **options**
  - A - Play an announcement to the called party, where x is the prompt to be played
    - x - The file to play to the called party
  - a - Immediately answer the calling channel when the called channel answers in all cases. Normally, the calling channel is answered when the called channel answers, but when options such as A() and M() are used, the calling channel is not answered until all actions on the called channel (such as playing an announcement) are completed. This option can be used to answer the calling channel before doing anything on the called channel. You will rarely need to use this option, the default behavior is adequate in most cases.
  - b - Before initiating an outgoing call, Gosub to the specified location using the newly created channel. The Gosub will be executed for each destination channel.
    - context
    - exten
    - priority
    - arg1
    - argN
  - B - Before initiating the outgoing call(s), Gosub to the specified location using the current channel.
- **context**
- **exten**
- **priority**
  - **arg1**
  - **argN**

- c - Reset the call detail record (CDR) for this call.
- c - If the Dial() application cancels this call, always set HANGUPCAUSE to ‘answered elsewhere’
- d - Allow the calling user to dial a 1 digit extension while waiting for a call to be answered. Exit to that extension if it exists in the current context, or the context defined in the EXITCONTEXT variable, if it exists.
- d - Send the specified DTMF strings after the called party has answered, but before the call gets bridged. The called DTMF string is sent to the called party, and the calling DTMF string is sent to the calling party. Both arguments can be used alone. If progress is specified, its DTMF is sent to the called party immediately after receiving a PROGRESS message. See SendDTMF for valid digits.
  - **called**
  - **calling**
  - **progress**
- e - Execute the extension for peer after the call ends
- f - If x is not provided, force the CallerID sent on a call-forward or deflection to the dialplan extension of this Dial() using a dialplan hint. For example, some PSTNs do not allow CallerID to be set to anything other than the numbers assigned to you. If x is provided, force the CallerID sent to x.
  - **x**
- f - When the caller hangs up, transfer the called party to the specified destination and start execution at that location.
  - **context**
  - **exten**
  - **priority**
- f - When the caller hangs up, transfer the called party to the next priority of the current extension and start execution at that location.
- g - Proceed with dialplan execution at the next priority in the current extension if the destination channel hangs up.
- g - If the call is answered, transfer the calling party to the specified priority and the called party to the specified priority plus one.
  - **context**
  - **exten**
  - **priority**
- h - Allow the called party to hang up by sending the DTMF sequence defined for disconnect in features.conf.
- h - Allow the calling party to hang up by sending the DTMF sequence defined for disconnect in features.conf.
- i - Asterisk will ignore any forwarding requests it may receive on this dial attempt.
- i - Asterisk will ignore any connected line update requests or any redirecting party update requests it may receive on this dial attempt.
- k - Allow the called party to enable parking of the call by sending the DTMF sequence defined for call parking in features.conf.
- k - Allow the calling party to enable parking of the call by sending the DTMF sequence defined for call parking in features.conf.
- l - Limit the call to x milliseconds. Play a warning when y milliseconds are left. Repeat the warning every z milliseconds until time expires.
  
  This option is affected by the following variables:
  - LIMIT_PLAYAUDIO_CALLER - If set, this variable causes Asterisk to play the prompts to the caller.
    - YES default: (true)
    - NO
  - LIMIT_PLAYAUDIO_CALLEE - If set, this variable causes Asterisk to play the prompts to the callee.
    - YES
    - NO default: (true)
  - LIMIT_TIMEOUT_FILE - If specified, filename specifies the sound prompt to play when the timeout is reached. If not set, the time remaining will be announced.
    - FILENAME
  - LIMIT_CONNECT_FILE - If specified, filename specifies the sound prompt to play when the call begins. If not set, the time remaining will be announced.
    - FILENAME
  - LIMIT_WARNING_FILE - If specified, filename specifies the sound prompt to play as a warning when time x is reached. If not set, the time remaining will be announced.
    - FILENAME
  - x - Maximum call time, in milliseconds
  - y - Warning time, in milliseconds
  - z - Repeat time, in milliseconds
- m - Provide hold music to the calling party until a requested channel answers. A specific music on hold class (as defined in musiconhold.conf) can be specified.
  - **class**
- M - Execute the specified macro for the called channel before connecting to the calling channel. Arguments can be specified to the Macro using ^ as a delimiter. The macro can set the variable MACRO_RESULT to specify the following actions after the macro is finished executing:
  - **MACRO_RESULT** - If set, this action will be taken after the macro finished executing.
    - ABORT - Hangup both legs of the call
CONGESTION - Behave as if line congestion was encountered
BUSY - Behave as if a busy signal was encountered
CONTINUE - Hangup the called party and allow the calling party to continue dialplan execution at the next priority
GOTO:context<exten><priority> - Transfer the call to the specified destination.

**macro** - Name of the macro that should be executed.
**arg** - Macro arguments

n - This option is a modifier for the call screening/privacy mode. (See the p and r options.) It specifies that no introductions are to be saved in the priv-callerintro directory.
delete - With delete either not specified or set to 0, the recorded introduction will not be deleted if the caller hangs up while the remote party has not yet answered.
With delete set to 1, the introduction will always be deleted.

N - This option is a modifier for the call screening/privacy mode. It specifies that if Caller*ID is present, do not screen the call.
o - If x is not provided, specify that the CallerID that was present on the calling channel be stored as the CallerID on the called channel. This was the behavior of Asterisk 1.0 and earlier. If x is provided, specify the CallerID stored on the called channel. Note that o([CALLERID(all)]) is similar to option o without the parameter.
x

p - Enables operator services mode. This option only works when bridging a DAHDI channel to another DAHDI channel only, if specified on non-DAHDI interfaces, it will be ignored. When the destination answers (presumably an operator services station), the originator no longer has control of their line. They may hang up, but the switch will not release their line until the destination party (the operator) hangs up.
mode - With mode either not specified or set to 1, the originator hanging up will cause the phone to ring back immediately.
With mode set to 2, when the operator flashes the trunk, it will ring their phone back.
p - This option enables screening mode. This is basically Privacy mode without memory.
r - Enable privacy mode. Use x as the family/key in the AstDB database if it is provided. The current extension is used if a family database/key is not specified.
x

c - Default: Indicate ringing to the calling party, even if the called party isn't actually ringing. Pass no audio to the calling party until the called channel has answered.
tone - Indicate progress to calling party. Send audio 'tone' from the indications.conf tonezone currently in use.
r - Default: Indicate ringing to the calling party, even if the called party isn't actually ringing. Allow interruption of the ringback if early media is received on the channel.
s - Hang up the call x seconds after the called party has answered the call.
x

s - Force the outgoing callerid tag parameter to be set to the string x. Works with the f option.
x

t - Allow the called party to transfer the calling party by sending the DTMF sequence defined in features.conf. This setting does not perform policy enforcement on transfers initiated by other methods.
T - Allow the calling party to transfer the called party by sending the DTMF sequence defined in features.conf. This setting does not perform policy enforcement on transfers initiated by other methods.
U - Execute via Gosub the routine x for the called channel before connecting to the calling channel. Arguments can be specified to the Gosub using ^ as a delimiter. The Gosub routine can set the variable GOSUB_RESULT to specify the following actions after the Gosub returns.

GOSUB_RESULT
*ABORT - Hangup both legs of the call.
CONGESTION - Behave as if line congestion was encountered.
BUSY - Behave as if a busy signal was encountered.
CONTINUE - Hangup the called party and allow the calling party to continue dialplan execution at the next priority.
GOTO:context<exten><priority> - Transfer the call to the specified destination.
x - Name of the subroutine to execute via Gosub
arg - Arguments for the Gosub routine

u - Works with the f option.
x - Force the outgoing callerid presentation indicator parameter to be set to one of the values passed in x.permitted:allowed_screen prohibited_screen prohibited_failed_screen prohibited_not_screened prohibited

w - Allow the called party to enable recording of the call by sending the DTMF sequence defined for one-touch recording in features.conf.
x - Allow the called party to enable recording of the call by sending the DTMF sequence defined for one-touch recording in features.conf.
x - Allow the called party to enable recording of the call by sending the DTMF sequence defined for one-touch automixmonitor in features.conf.
x - Allow the called party to enable recording of the call by sending the DTMF sequence defined for one-touch automixmonitor in features.conf.

z - On a call forward, cancel any dial timeout which has been set for this call.

URL - The optional URL will be sent to the called party if the channel driver supports it.

Asterisk 14 Application_Dictate

Dictate()

Synopsis

Virtual Dictation Machine.

Description

Start dictation machine using optional base_dir for files.

Syntax

Dictate([base_dir,[filename]])

Arguments

- base_dir
- filename

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Directory

Directory()

Synopsis

Provide directory of voicemail extensions.

Description

This application will present the calling channel with a directory of extensions from which they can search by name. The list of names and corresponding extensions is retrieved from the voicemail configuration file, voicemail.conf.

This application will immediately exit if one of the following DTMF digits are received and the extension to jump to exists:

0 - Jump to the 'o' extension, if it exists.
- - Jump to the 'a' extension, if it exists.

This application will set the following channel variable before completion:

- DIRECTORY_RESULT - Reason Directory application exited.
  - OPERATOR - User requested operator
  - ASSISTANT - User requested assistant
  - TIMEOUT - User allowed DTMF wait duration to pass without sending DTMF
  - HANGUP - The channel hung up before the application finished
  - SELECTED - User selected a user to call from the directory
  - USEREXIT - User exited with '#' during selection
  - FAILED - The application failed

Syntax

Directory([vm-context,[dial-context,[options]]])

Arguments

- vm-context - This is the context within voicemail.conf to use for the Directory. If not specified and searchcontexts=no in voicemail.conf, then default will be assumed.
- dial-context - This is the dialplan context to use when looking for an extension that the user has selected, or when jumping to the o o extension. If not specified, the current context will be used.
- options - In addition to the name, also read the extension number to the caller before presenting dialing options.
  - e - Allow the caller to enter the first name of a user in the directory instead of using the last name. If specified, the optional number argument will be used for the number of characters the user should enter.
  - l - Allow the caller to enter the last name of a user in the directory. This is the default. If specified, the optional number argument will be used for the number of characters the user should enter.
  - b - Allow the caller to enter either the first or the last name of a user in the directory. If specified, the optional number argument will be used for the number of characters the user should enter.
  - a - Allow the caller to additionally enter an alias for a user in the directory. This option must be specified in addition to the e, l, or b option.
  - n - Instead of reading each name sequentially and asking for confirmation, create a menu of up to 8 names.
  - m - Pause for n milliseconds after the digits are typed. This is helpful for people with cellphones, who are not holding the receiver to their ear while entering DTMF.

Note

Only one of the e, l, or b options may be specified. If more than one is specified, then Directory will act as if b was specified. The number of characters for the user to type defaults to 3.

Asterisk 14 Application_DISA

DISA()

Synopsis

Direct Inward System Access.

Description

The DISA, Direct Inward System Access, application allows someone from outside the telephone switch (PBX) to obtain an internal system dialtone and to place calls from it as if they were placing a call from within the switch. DISA plays a dialtone. The user enters their numeric passcode, followed by the pound sign #. If the passcode is correct, the user is then given system dialtone within context on which a call may be placed. If the user enters an invalid extension and extension exists in the specified context, it will be used.

Be aware that using this may compromise the security of your PBX.

The arguments to this application (in extensions.conf) allow either specification of a single global passcode (that everyone uses), or individual passcodes contained in a file (filename).

The file that contains the passcodes (if used) allows a complete specification of all of the same arguments available on the command line, with the sole exception of the options. The file may contain blank lines, or comments starting with # or ;.

Syntax

```
DISA(passcode|filename,[context,[cid,mailbox@[context],[options]]])
```

Arguments

- **passcode|filename** - If you need to present a DISA dialtone without entering a password, simply set passcode to no-password. You may specified a filename instead of a passcode, this filename must contain individual passcodes.
- **context** - Specifies the dialplan context in which the user-entered extension will be matched. If no context is specified, the DISA application defaults to the disa context. Presumably a normal system will have a special context set up for DISA use with some or a lot of restrictions.
- **cid** - Specifies a new (different) callerid to be used for this call.
- **mailbox** - Will cause a stutter-dialtone (indication dialrecall) to be used, if the specified mailbox contains any new messages.
  - mailbox
  - context
- **options**
  - n - The DISA application will not answer initially.
  - p - The extension entered will be considered complete when a # is entered.

Asterisk 14 Application_DumpChan

DumpChan()

Synopsis

Dump Info About The Calling Channel.

Description

Displays information on channel and listing of all channel variables. If level is specified, output is only displayed when the verbose level is currently set to that number or greater.

Syntax

DumpChan([level])

Arguments

- level - Minimum verbose level

See Also

- Asterisk 14 Application_NoOp

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_EAGI

EAGI()

Synopsis

Executes an EAGI compliant application.

Description

Using ‘EAGI’ provides enhanced AGI, with incoming audio available out of band on file descriptor 3.

Executes an Asterisk Gateway Interface compliant program on a channel. AGI allows Asterisk to launch external programs written in any language to control a telephony channel, play audio, read DTMF digits, etc. by communicating with the AGI protocol on stdin and stdout. As of 1.6.0, this channel will not stop dialplan execution on hangup inside of this application. Dialplan execution will continue normally, even upon hangup until the AGI application signals a desire to stop (either by exiting or, in the case of a net script, by closing the connection). A locally executed AGI script will receive SIGHUP on hangup from the channel except when using DeadAGI. A fast AGI server will correspondingly receive a HANGUP inline with the command dialog. Both of these signals may be disabled by setting the AGISIGHUP channel variable to no before executing the AGI application. Alternatively, if you would like the AGI application to exit immediately after a channel hangup is detected, set the AGIEXITONHANGUP variable to yes.

Use the CLI command agi show commands to list available agi commands.

This application sets the following channel variable upon completion:

- AGISTATUS - The status of the attempt to run the AGI script text string, one of:
  - SUCCESS
  - FAILURE
  - NOTFOUND
  - HANGUP

Syntax

EAGI(command,arg1,[arg2[,...]])

Arguments

- command
- args
  - arg1
  - arg2

See Also

- Asterisk 14 Application_AGI
- Asterisk 14 Application_DeadAGI

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Echo

Echo()

Synopsis
Echo media, DTMF back to the calling party

Description
Echoes back any media or DTMF frames read from the calling channel back to itself. This will not echo CONTROL, MODEM, or NULL frames. Note: If '#' detected application exits.

This application does not automatically answer and should be preceded by an application such as Answer() or Progress().

Syntax

```
Echo()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_EndWhile

EndWhile()

Synopsis
End a while loop.

Description
Return to the previous called While().

Syntax

```
EndWhile()
```

Arguments

See Also

- Asterisk 14 Application_While
- Asterisk 14 Application_ExitWhile
- Asterisk 14 Application_ContinueWhile

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Exec

Exec()

Synopsis
Executes dialplan application.

Description
Allows an arbitrary application to be invoked even when not hard coded into the dialplan. If the underlying application terminates the dialplan, or if the application cannot be found, Exec will terminate the dialplan.

To invoke external applications, see the application System. If you would like to catch any error instead, see TryExec.

Syntax

```plaintext
Exec(appname(arguments))
```

Arguments

- **appname** - Application name and arguments of the dialplan application to execute.
- **arguments**

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ExecIf

ExecIf()

Synopsis

Executes dialplan application, conditionally.

Description

If `expr` is true, execute and return the result of `appiftrue(args)`.

If `expr` is true, but `appiftrue` is not found, then the application will return a non-zero value.

Syntax

```
ExecIf(expression?appiftrue:[appiffalse])
```

Arguments

- `expression`
- `execapp`
  - `appiftrue`
    - `args`
  - `appiffalse`
    - `args`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ExecIfTime

ExecIfTime()

Synopsis
Conditional application execution based on the current time.

Description
This application will execute the specified dialplan application, with optional arguments, if the current time matches the given time specification.

Syntax

```
ExecIfTime(times, weekdays, mdays, months, [timezone]? appname[(appargs)])
```

Arguments

- `day_condition`
  - `times`
  - `weekdays`
  - `mdays`
  - `months`
  - `timezone`
- `appname`
  - `appargs`

Asterisk 14 Application ExitWhile

ExitWhile()

Synopsis
End a While loop.

Description
Exits a While() loop, whether or not the conditional has been satisfied.

Syntax
ExitWhile()

Arguments

See Also
- Asterisk 14 Application While
- Asterisk 14 Application EndWhile
- Asterisk 14 Application ContinueWhile

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ExtenSpy

ExtenSpy()

Synopsis

Listen to a channel, and optionally whisper into it.

Description

This application is used to listen to the audio from an Asterisk channel. This includes the audio coming in and out of the channel being spied on. Only channels created by outgoing calls for the specified extension will be selected for spying. If the optional context is not supplied, the current channel's context will be used.

While spying, the following actions may be performed:

- Dialing # cycles the volume level.
- Dialing * will stop spying and look for another channel to spy on.

Note

The X option supersedes the three features above in that if a valid single digit extension exists in the correct context ChanSpy will exit to it. This also disables choosing a channel based on chanprefix and a digit sequence.

Syntax

```
ExtenSpy(exten@[context],[options])
```

Arguments

- `exten`
  - Specify extension.
  - `context` - Optionally specify a context, defaults to default.
- `options`
  - `b` - Only spy on channels involved in a bridged call.
  - `B` - Instead of whispering on a single channel barge in on both channels involved in the call.
  - `c`
    - `digit` - Specify a DTMF digit that can be used to spy on the next available channel.
  - `d` - Override the typical numeric DTMF functionality and instead use DTMF to switch between spy modes.
    - `4` - spy mode
    - `5` - whisper mode
    - `6` - barge mode
  - `e` - Enable enforced mode, so the spying channel can only monitor extensions whose name is in the `ext` : delimited list.
    - `ext`
  - `E` - Exit when the spied-on channel hangs up.
  - `g`
    - `grp` - Only spy on channels in which one or more of the groups listed in `grp` matches one or more groups from the `SPYGROUP` variable set on the channel to be spied upon.
  - `l` - Allow usage of a long queue to store audio frames.
  - `n` - Say the name of the person being spied on if that person has recorded his/her name. If a context is specified, then that voicemail context will be searched when retrieving the name, otherwise the `default` context be used when searching for the name (i.e. if SIP/1000 is the channel being spied on and no mailbox is specified, then 1000 will be used when searching for the name).
    - `mailbox`
      - `context`
  - `o` - Only listen to audio coming from this channel.
  - `q` - Don't play a beep when beginning to spy on a channel, or speak the selected channel name.
  - `r` - Record the session to the monitor spool directory. An optional base for the filename may be specified. The default is `chansp`
    - `basename`
  - `s` - Skip the playback of the channel type (i.e. SIP, IAX, etc) when speaking the selected channel name.
  - `S` - Stop when there are no more extensions left to spy on.
  - `v` - Adjust the initial volume in the range from -4 to 4. A negative value refers to a quieter setting.
    - `value`
  - `w` - Enable whisper mode, so the spying channel can talk to the spied-on channel.
  - `W` - Enable private whisper mode, so the spying channel can talk to the spied-on channel but cannot listen to that channel.
• **x**
  • `digit` - Specify a DTMF digit that can be used to exit the application while actively spying on a channel. If there is no channel being spied on, the DTMF digit will be ignored.

• **X** - Allow the user to exit ChanSpy to a valid single digit numeric extension in the current context or the context specified by the `SPY_EXIT_CONTEXT` channel variable. The name of the last channel that was spied on will be stored in the `SPY_CHANNEL` variable.

Asterisk 14 Application _ ExternallVR

ExternallVR()

Synopsis

Interfaces with an external IVR application.

Description

Either forks a process to run given command or makes a socket to connect to given host and starts a generator on the channel. The generator's play list is controlled by the external application, which can add and clear entries via simple commands issued over its stdout. The external application will receive all DTMF events received on the channel, and notification if the channel is hung up. The received on the channel, and notification if the channel is hung up. The application will not be forcibly terminated when the channel is hung up. For more information see doc/AST.pdf.

Syntax

```
ExternallVR(command|ivr://host([arg1,[arg2,...]]),[options])
```

Arguments

- command|ivr://host
  - arg1
  - arg2
- options
  - n - Tells ExternallVR() not to answer the channel.
  - i - Tells ExternallVR() not to send a hangup and exit when the channel receives a hangup, instead it sends an informative message meaning that the external application MUST hang up the call with an i command.
  - d - Tells ExternallVR() to run on a channel that has been hung up and will not look for hangups. The external application must exit with an i command.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Festival

Festival()

Synopsis
Say text to the user.

Description
Connect to Festival, send the argument, get back the waveform, play it to the user, allowing any given interrupt keys to immediately terminate and return the value, or any to allow any number back (useful in dialplan).

Syntax

```
Festival(text,[intkeys])
```

Arguments

- `text`
- `intkeys`

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Flash

Flash()

Synopsis
Flashes a DAHDI Trunk.

Description
Performs a flash on a DAHDI trunk. This can be used to access features provided on an incoming analogue circuit such as conference and call waiting. Use with SendDTMF() to perform external transfers.

Syntax
Flash()

Arguments

See Also

Asterisk 14 Application_SendDTMF

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_FollowMe

FollowMe()

Synopsis

Find-Me/Follow-Me application.

Description

This application performs Find-Me/Follow-Me functionality for the caller as defined in the profile matching the followmeid parameter in followme.conf. If the specified followmeid profile doesn't exist in followme.conf, execution will be returned to the dialplan and call execution will continue at the next priority.

Returns -1 on hangup.

Syntax

```
FollowMe(followmeid,[options])
```

Arguments

- `followmeid`
- `options`
  - `a` - Record the caller's name so it can be announced to the callee on each step.
  - `B` - Before initiating the outgoing call(s), Gosub to the specified location using the current channel.
    - `context`
    - `exten`
    - `priority`
      - `arg1`
      - `argN`
  - `b` - Before initiating an outgoing call, Gosub to the specified location using the newly created channel. The Gosub will be executed for each destination channel.
    - `context`
    - `exten`
    - `priority`
      - `arg1`
      - `argN`
  - `d` - Disable the 'Please hold while we try to connect your call' announcement.
  - `I` - Asterisk will ignore any connected line update requests it may receive on this dial attempt.
  - `l` - Disable local call optimization so that applications with audio hooks between the local bridge don't get dropped when the calls get joined directly.
  - `N` - Don't answer the incoming call until we're ready to connect the caller or give up.
  - `n` - Playback the unreachable status message if we've run out of steps or the callee has elected not to be reachable.
  - `s` - Playback the incoming status message prior to starting the follow-me step(s)

Asterisk 14 Application_ForkCDR

ForkCDR()

Synopsis
Forks the current Call Data Record for this channel.

Description
Causes the Call Data Record engine to fork a new CDR starting from the time the application is executed. The forked CDR will be linked to the end of the CDRs associated with the channel.

Syntax

ForkCDR([options])

Arguments

- **options**
  - **a** - If the channel is answered, set the answer time on the forked CDR to the current time. If this option is not used, the answer time on the forked CDR will be the answer time on the original CDR. If the channel is not answered, this option has no effect. Note that this option is implicitly assumed if the **r** option is used.
  - **e** - End (finalize) the original CDR.
  - **r** - Reset the start and answer times on the forked CDR. This will set the start and answer times (if the channel is answered) to be set to the current time. Note that this option implicitly assumes the **a** option.
  - **v** - Do not copy CDR variables and attributes from the original CDR to the forked CDR.

Asterisk 14 Application_GetCPEID

GetCPEID()

Synopsis
Get ADSI CPE ID.

Description
Obtains and displays ADSI CPE ID and other information in order to properly setup `dahdi.conf` for on-hook operations.

Syntax

```
GetCPEID()
```

Arguments

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Gosub

Gosub()

Synopsis
Jump to label, saving return address.

Description
Jumps to the label specified, saving the return address.

Syntax

Gosub([[context, [exten, ] ] priority [[arg1, [...] [argN]]]]

Arguments

- context
- exten
- priority
  - arg1
  - argN

See Also

- Asterisk 14 Application_GosubIf
- Asterisk 14 Application_Macro

Asterisk 14 Application_GosubIf

GosubIf()

Synopsis

Conditionally jump to label, saving return address.

Description

If the condition is true, then jump to labeliftrue. If false, jumps to labeliffalse, if specified. In either case, a jump saves the return point in the dialplan, to be returned to with a Return.

Syntax

GosubIf(condition?[labeliftrue:[labeliffalse]])

Arguments

- condition
- destination
  - labeliftrue - Continue at labeliftrue if the condition is true. Takes the form similar to Goto() of [[context,]extension,,]priority.
    - arg1
    - argN
  - labeliffalse - Continue at labeliffalse if the condition is false. Takes the form similar to Goto() of [[context,]extension,]priority.
    - arg1
    - argN

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Goto

Goto()

Synopsis

Jump to a particular priority, extension, or context.

Description

This application will set the current context, extension, and priority in the channel structure. After it completes, the pbx engine will continue dialplan execution at the specified location. If no specific extension, or extension and context, are specified, then this application will just set the specified priority of the current extension.

At least a priority is required as an argument, or the goto will return a –1 and the channel and call will be terminated.

If the location that is put into the channel information is bogus, and asterisk cannot find that location in the dialplan, then the execution engine will try to find and execute the code in the lowest (invalid) extension in the current context. If that does not exist, it will try to execute the highest extension. If neither the lowest nor highest extensions have been defined, the channel is hung up, and the execution of instructions on the channel is terminated. What this means is that, for example, you specify a context that does not exist, then it will not be possible to find the lowest or highest extensions, and the call will terminate!

Syntax

```
Goto([context, [extensions, ]]priority)
```

Arguments

- context
- extensions
- priority

See Also

- Asterisk 14 Application_Gotolf
- Asterisk 14 Application_GotolfTime
- Asterisk 14 Application_Gosub
- Asterisk 14 Application_Macro

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_GotoIf

GotoIf()

Synopsis

Conditional goto.

Description

This application will set the current context, extension, and priority in the channel structure based on the evaluation of the given condition. After this application completes, the pbx engine will continue dialplan execution at the specified location in the dialplan. The labels are specified with the same syntax as used within the Goto application. If the label chosen by the condition is omitted, no jump is performed, and the execution passes to the next instruction. If the target location is bogus, and does not exist, the execution engine will try to find and execute the code in the i (invalid) extension in the current context. If that does not exist, it will try to execute the h extension. If neither the h nor i extensions have been defined, the channel is hung up, and the execution of instructions on the channel is terminated. Remember that this command can set the current context, and if the context specified does not exist, then it will not be able to find any 'h' or 'i' extensions there, and the channel and call will both be terminated!

Syntax

GotoIf(condition?[labeliftrue:[labeliffalse]])

Arguments

- condition
- destination
  - labeliftrue - Continue at labeliftrue if the condition is true. Takes the form similar to Goto() of [[context,]extension,]priority.
  - labeliffalse - Continue at labeliffalse if the condition is false. Takes the form similar to Goto() of [[context,]extension,]priority.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_GotoIfTime

GotolIfTime()

Synopsis

Conditional Goto based on the current time.

Description

This application will set the context, extension, and priority in the channel structure based on the evaluation of the given time specification. After this application completes, the pbx engine will continue dialplan execution at the specified location in the dialplan. If the current time is within the given time specification, the channel will continue at labeliftrue. Otherwise the channel will continue at labeliffalse. If the label chosen by the condition is omitted, no jump is performed, and execution passes to the next instruction. If the target jump location is bogus, the same actions would be taken as for Goto. Further information on the time specification can be found in examples illustrating how to do time-based context includes in the dialplan.

Syntax

```
GotoIfTime(times, weekdays, mdays, months, [timezone]?
           [labeliftrue:[labeliffalse]])
```

Arguments

- condition
  - times
  - weekdays
  - mdays
  - months
  - timezone
- destination
  - labeliftrue - Continue at labeliftrue if the condition is true. Takes the form similar to Goto() of [[context],extension],priority.
  - labeliffalse - Continue at labeliffalse if the condition is false. Takes the form similar to Goto() of [[context],extension],priority.

Asterisk 14 Application_Hangup

Hangup()

Synopsis
Hang up the calling channel.

Description
This application will hang up the calling channel.

Syntax

\[\text{Hangup}([\text{causecode}])\]

Arguments

- `causecode` - If a `causecode` is given the channel's hangup cause will be set to the given value.

Asterisk 14 Application_IAX2Provision

IAX2Provision()

Synopsis

Provision a calling IAXy with a given template.

Description

Provisions the calling IAXy (assuming the calling entity is in fact an IAXy) with the given template. Returns -1 on error or 0 on success.

Syntax

```
IAX2Provision([template])
```

Arguments

- `template` - If not specified, defaults to default.

Asterisk 14 Application_ICES

ICES()

Synopsis

Encode and stream using 'ices'.

Description

Streams to an icecast server using ices (available separately). A configuration file must be supplied for ices (see contrib/asterisk-ices.xml).

Note

ICES version 2 client and server required.

Syntax

ICES(config)

Arguments

- config - ICES configuration file.

Asterisk 14 Application_ImportVar

ImportVar()

Synopsis

Import a variable from a channel into a new variable.

Description

This application imports a variable from the specified channel (as opposed to the current one) and stores it as a variable (newvar) in the current channel (the channel that is calling this application). Variables created by this application have the same inheritance properties as those created with the Set application.

Syntax

```
ImportVar(newvar=channelname,variable)
```

Arguments

- newvar
- vardata
  - channelname
  - variable

See Also

- Asterisk 14 Application_Set

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Incomplete

Incomplete()

Synopsis

Returns AST_PBX_INCOMPLETE value.

Description

Signals the PBX routines that the previous matched extension is incomplete and that further input should be allowed before matching can be considered to be complete. Can be used within a pattern match when certain criteria warrants a longer match.

Syntax

Incomplete([n])

Arguments

- n - If specified, then Incomplete will not attempt to answer the channel first.

Note

Most channel types need to be in Answer state in order to receive DTMF.

Asterisk 14 Application_IVRDemo

IVRDemo()

Synopsis
IVR Demo Application.

Description
This is a skeleton application that shows you the basic structure to create your own asterisk applications and demonstrates the IVR demo.

Syntax

```
IVRDemo(filename)
```

Arguments

- `filename`

See Also

Asterisk 14 Application_JabberJoin_res_xmpp

JabberJoin() - [res_xmpp]

Synopsis
Join a chat room

Description
Allows Asterisk to join a chat room.

Syntax
JabberJoin(Jabber,RoomJID,[Nickname])

Arguments
- Jabber - Client or transport Asterisk uses to connect to Jabber.
- RoomJID - XMPP/Jabber JID (Name) of chat room.
- Nickname - The nickname Asterisk will use in the chat room.

Note
If a different nickname is supplied to an already joined room, the old nick will be changed to the new one.

Asterisk 14 Application_JabberLeave_res_xmpp

JabberLeave() - [res_xmpp]

Synopsis
Leave a chat room

Description
Allows Asterisk to leave a chat room.

Syntax

| JabberLeave(Jabber,RoomJID,[Nickname]) |

Arguments

- **Jabber** - Client or transport Asterisk uses to connect to Jabber.
- **RoomJID** - XMPP/Jabber JID (Name) of chat room.
- **Nickname** - The nickname Asterisk uses in the chat room.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
**Asterisk 14 Application_JabberSend_res_xmpp**

**JabberSend() - [res_xmpp]**

**Synopsis**

Sends an XMPP message to a buddy.

**Description**

Sends the content of *message* as text message from the given *account* to the buddy identified by *jid*

Example: `JabberSend(asterisk,bob@domain.com,Hello world)` sends "Hello world" to `bob@domain.com` as an XMPP message from the account `asterisk`, configured in xmpp.conf.

**Syntax**

```
JabberSend(account,jid,message)
```

**Arguments**

- **account** - The local named account to listen on (specified in xmpp.conf)
- **jid** - Jabber ID of the buddy to send the message to. It can be a bare JID (username@domain) or a full JID (username@domain/resource).
- **message** - The message to send.

**See Also**

Asterisk 14 Application_JabberSendGroup_res_xmpp

JabberSendGroup() - [res_xmpp]

Synopsis
Send a Jabber Message to a specified chat room

Description
Allows user to send a message to a chat room via XMPP.

```
Note
To be able to send messages to a chat room, a user must have previously joined it. Use the JabberJoin function to do so.
```

Syntax

```
JabberSendGroup(Jabber, RoomJID, Message, [Nickname])
```

Arguments

- **Jabber** - Client or transport Asterisk uses to connect to Jabber.
- **RoomJID** - XMPP/Jabber JID (Name) of chat room.
- **Message** - Message to be sent to the chat room.
- **Nickname** - The nickname Asterisk uses in the chat room.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_JabberStatus_res_xmpp

JabberStatus() - [res_xmpp]

Synopsis

Retrieve the status of a jabber list member

Description

This application is deprecated. Please use the JABBER_STATUS() function instead.

Retrieves the numeric status associated with the specified buddy JID. The return value in the _Variable_ will be one of the following.

- 1 - Online.
- 2 - Chatty.
- 3 - Away.
- 4 - Extended Away.
- 5 - Do Not Disturb.
- 6 - Offline.
- 7 - Not In Roster.

Syntax

```
JabberStatus(Jabber,JID,Variable)
```

Arguments

- **Jabber** - Client or transport Asterisk users to connect to Jabber.
- **JID** - XMPP/Jabber JID (Name) of recipient.
- **Variable** - Variable to store the status of requested user.

Asterisk 14 Application_JACK

JACK()

Synopsis
Jack Audio Connection Kit

Description
When executing this application, two jack ports will be created; one input and one output. Other applications can be hooked up to these ports to access audio coming from, or being send to the channel.

Syntax

JACK{[optional]}

Arguments

- options
- s
  - name - Connect to the specified jack server name
- i
  - name - Connect the output port that gets created to the specified jack input port
- o
  - name - Connect the input port that gets created to the specified jack output port
- c
  - name - By default, Asterisk will use the channel name for the jack client name. Use this option to specify a custom client name.

Asterisk 14 Application_Log

Log()

Synopsis
Send arbitrary text to a selected log level.

Description
Sends an arbitrary text message to a selected log level.

Syntax

```
Log(level,message)
```

Arguments

- **level** - Level must be one of **ERROR**, **WARNING**, **NOTICE**, **DEBUG**, **VERBOSE** or **DTMF**.
- **message** - Output text message.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Macro

Macro()

Synopsis

Macro Implementation.

Description

Executes a macro using the context macro- name, jumping to the extension of that context and executing each step, then returning when the steps end.

The calling extension, context, and priority are stored in MACRO_EXTEN, MACRO_CONTEXT and MACRO_PRIORITY respectively. Arguments become ARG1, ARG2, etc in the macro context.

If you Goto out of the Macro context, the Macro will terminate and control will be returned at the location of the Goto.

If MACRO_OFFSET is set at termination, Macro will attempt to continue at priority MACRO_OFFSET + N + 1 if such a step exists, and N + 1 otherwise.

Warning

Because of the way Macro is implemented (it executes the priorities contained within it via sub-engine), and a fixed per-thread memory stack allowance, macros are limited to 7 levels of nesting (macro calling macro calling macro, etc.). It may be possible that stack-intensive applications in deeply nested macros could cause asterisk to crash earlier than this limit. It is advised that if you need to deeply nest macro calls, that you use the Gosub application (now allows arguments like a Macro) with explicit Return() calls instead.

Warning

Use of the application WaitExten within a macro will not function as expected. Please use the Read application in order to read DTMF from a channel currently executing a macro.

Syntax

Macro(name, arg1, [arg2[, ...]])

Arguments

- name - The name of the macro
- args
  - arg1
  - arg2

See Also

- Asterisk 14 Application_MacroExit
- Asterisk 14 Application_Goto
- Asterisk 14 Application_Gosub

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MacroExclusive

MacroExclusive()

Synopsis

Exclusive Macro Implementation.

Description

Executes macro defined in the context macro- name. Only one call at a time may run the macro. (we’ll wait if another call is busy executing in the Macro) Arguments and return values as in application Macro()

⚠️ Warning

Use of the application WaitExten within a macro will not function as expected. Please use the Read application in order to read DTMF from a channel currently executing a macro.

Syntax

```python
MacroExclusive(name,[arg1,[arg2]],...])
```

Arguments

- name - The name of the macro
- arg1
- arg2

See Also

- Asterisk 14 Application_Macro

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 ApplicationMacroExit

MacroExit()

Synopsis

Exit from Macro.

Description

Causes the currently running macro to exit as if it had ended normally by running out of priorities to execute. If used outside a macro, will likely cause unexpected behavior.

Syntax

MacroExit()

Arguments

See Also

- Asterisk 14 Application_Macro

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MacroIf

MacroIf()

Synopsis

Conditional Macro implementation.

Description

Executes macro defined in `macroiftrue` if `expr` is true (otherwise `macroiffalse` if provided)

Arguments and return values as in application Macro()

⚠️ Warning

Use of the application `WaitExten` within a macro will not function as expected. Please use the `Read` application in order to read DTMF from a channel currently executing a macro.

Syntax

```
MacroIf(expr?macroiftrue:[macroiffalse])
```

Arguments

- `expr`
- `destination`
- `macroiftrue`
  - `macroiftrue`
  - `arg1`
- `macroiffalse`
  - `macroiffalse`
  - `arg1`

See Also

- Asterisk 14 Application_GotoIf
- Asterisk 14 Application_GosubIf

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MailboxExists

MailboxExists()

Synopsis

Check to see if Voicemail mailbox exists.

Description

Note
DEPRECATED. Use VM_INFO(mailbox[@context],exists) instead.

Check to see if the specified mailbox exists. If no voicemail context is specified, the default context will be used.

This application will set the following channel variable upon completion:

- **VMBOXEXISTSSSTATUS** - This will contain the status of the execution of the MailboxExists application. Possible values include:
  - SUCCESS
  - FAILED

Syntax

```
MailboxExists(mailbox@[context],[options])
```

Arguments

- **mailbox**
  - mailbox
  - context
- **options** - None options.

See Also

- Asterisk 14 Function_VM_INFO

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MeetMe

MeetMe()

Synopsis

MeetMe conference bridge.

Description

Enters the user into a specified MeetMe conference. If the confno is omitted, the user will be prompted to enter one. User can exit the conference by hangup, or if the p option is specified, by pressing #.

Note
The DAHDI kernel modules and a functional DAHDI timing source (see dahdi_test) must be present for conferencing to operate properly. In addition, the chan_dahdi channel driver must be loaded for the i and r options to operate at all.

Syntax

```
MeetMe([confno,[options,[pin]]])
```

Arguments

- **confno** - The conference number
- **options**
  - a - Set admin mode.
  - A - Set marked mode.
  - b - Run AGI script specified in MEETME_AGI_BACKGROUND Default: conf-background.agi.
  - c - Announce user(s) count on joining a conference.
  - C - Continue in dialplan when kicked out of conference.
  - d - Dynamically add conference.
  - D - Dynamically add conference, prompting for a PIN.
  - e - Select an empty conference.
  - E - Select an empty pinless conference.
  - F - Pass DTMF through the conference.
  - G - Play an intro announcement in conference.
    - x - The file to playback
  - i - Announce user join/leave with review.
  - I - Announce user join/leave without review.
  - k - Close the conference if there’s only one active participant left at exit.
  - l - Set listen only mode (Listen only, no talking).
  - m - Set initially muted.
  - M - Enable music on hold when the conference has a single caller. Optionally, specify a musiconhold class to use. If one is not provided, it will use the channel’s currently set music class, or default.
    - class
  - n - Disable the denoiser. By default, if func_speex is loaded, Asterisk will apply a denoiser to channels in the MeetMe conference. However, channel drivers that present audio with a varying rate will experience degraded performance with a denoiser attached. This parameter allows a channel joining the conference to choose not to have a denoiser attached without having to unload func_speex.
  - o - Set talker optimization - treats talkers who aren’t speaking as being muted, meaning (a) No encode is done on transmission and (b) Received audio that is not registered as talking is omitted causing no buildup in background noise.
  - p - Allow user to exit the conference by pressing # (default) or any of the defined keys. Dial plan execution will continue at the next priority following MeetMe. The key used is set to channel variable MEETME_EXIT_KEY.
    - keys
  - P - Always prompt for the pin even if it is specified.
  - q - Quiet mode (don’t play enter/leave sounds).
  - S - Record conference (records as MEETME_RECORDINGFILE using format MEETME_RECORDINGFORMAT. Default filename is me etme-conf-rec-{$CONFNO}-${UNIQUEID} and the default format is wav.
  - s - Present menu (user or admin) when + is received (send to menu).
  - t - Set talk only mode. (Talk only, no listening).
  - T - Set talker detection (sent to manager interface and meetme list).
  - v - Announce when a user is joining or leaving the conference. Use the voicemail greeting as the announcement. If the i or l options are set, the application will fall back to them if no voicemail greeting can be found.
    - mailbox@context - The mailbox and voicemail context to play from. If no context provided, assumed context is default.
• w - Wait until the marked user enters the conference.
• secs
• x - Leave the conference when the last marked user leaves.
• X - Allow user to exit the conference by entering a valid single digit extension MEETME_EXIT_CONTEXT or the current context if that variable is not defined.
• l - Do not play message when first person enters
• s - Kick the user x seconds after he entered into the conference.
• x
• L - Limit the conference to x ms. Play a warning when y ms are left. Repeat the warning every z ms. The following special variables can be used with this option:
  • CONF_LIMIT_TIMEOUT_FILE: File to play when time is up.
  • CONF_LIMIT_WARNING_FILE: File to play as warning if y is defined. The default is to say the time remaining.
  • x
  • y
  • z

pin

Asterisk 14 Application_MeetMeAdmin

MeetMeAdmin()

Synopsis

MeetMe conference administration.

Description

Run admin command for conference confno.

Will additionally set the variable MEETMEADMINSTATUS with one of the following values:

- MEETMEADMINSTATUS
  - NOPARSE - Invalid arguments.
  - NOTFOUND - User specified was not found.
  - FAILED - Another failure occurred.
  - OK - The operation was completed successfully.

Syntax

```
MeetMeAdmin(confno,command,[user])
```

Arguments

- **confno**
- **command**
  - e - Eject last user that joined.
  - E - Extend conference end time, if scheduled.
  - k - Kick one user out of conference.
  - K - Kick all users out of conference.
  - l - Unlock conference.
  - L - Lock conference.
  - m - Unmute one user.
  - M - Mute one user.
  - n - Unmute all users in the conference.
  - N - Mute all non-admin users in the conference.
  - r - Reset one user's volume settings.
  - R - Reset all users volume settings.
  - s - Lower entire conference speaking volume.
  - S - Raise entire conference speaking volume.
  - t - Lower one user's talk volume.
  - T - Raise one user's talk volume.
  - u - Lower one user's listen volume.
  - U - Raise one user's listen volume.
  - v - Lower entire conference listening volume.
  - V - Raise entire conference listening volume.
- **user**

Asterisk 14 Application_MeetMeChannelAdmin

MeetMeChannelAdmin()

Synopsis

MeetMe conference Administration (channel specific).

Description

Run admin command for a specific channel in any conference.

Syntax

```
MeetMeChannelAdmin(channel,command)
```

Arguments

- channel
- command
  - k - Kick the specified user out of the conference he is in.
  - m - Unmute the specified user.
  - M - Mute the specified user.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MeetMeCount

MeetMeCount()

Synopsis

MeetMe participant count.

Description

Plays back the number of users in the specified MeetMe conference. If var is specified, playback will be skipped and the value will be returned in the variable. Upon application completion, MeetMeCount will hangup the channel, unless priority n+1 exists, in which case priority progress will continue.

Syntax

```plaintext
MeetMeCount(confno,[var])
```

Arguments

- `confno` - Conference number.
- `var`

See Also

- Asterisk 14 Application_MeetMe

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MessageSend

MessageSend()

Synopsis
Send a text message.

Description
Send a text message. The body of the message that will be sent is what is currently set to MESSAGE(body). The technology chosen for sending the message is determined based on a prefix to the to parameter.

This application sets the following channel variables:

- MESSAGE_SEND_STATUS - This is the message delivery status returned by this application.
  - INVALID_PROTOCOL - No handler for the technology part of the URI was found.
  - INVALID_URI - The protocol handler reported that the URI was not valid.
  - SUCCESS - Successfully passed on to the protocol handler, but delivery has not necessarily been guaranteed.
  - FAILURE - The protocol handler reported that it was unable to deliver the message for some reason.

Syntax

MessageSend(to,[from])

Arguments

- to - A To URI for the message.
  - Technology: PJSIP
    Specifying a prefix of pjsip: will send the message as a SIP MESSAGE request.
  - Technology: SIP
    Specifying a prefix of sip: will send the message as a SIP MESSAGE request.
  - Technology: XMPP
    Specifying a prefix of xmpp: will send the message as an XMPP chat message.

- from - A From URI for the message if needed for the message technology being used to send this message.
  - Technology: PJSIP
    The from parameter can be a configured endpoint or in the form of "display-name" <URI>.
  - Technology: SIP
    The from parameter can be a configured peer name or in the form of "display-name" <URI>.
  - Technology: XMPP
    Specifying a prefix of xmpp: will specify the account defined in xmpp.conf to send the message from. Note that this field is required for XMPP messages.

Asterisk 14 Application_Milliwatt

Milliwatt()

Synopsis

Generate a Constant 1004Hz tone at 0dbm (mu-law).

Description

Previous versions of this application generated the tone at 1000Hz. If for some reason you would prefer that behavior, supply the o option to get the old behavior.

Syntax

Milliwatt([options])

Arguments

- **options**
  - o - Generate the tone at 1000Hz like previous version.

See Also

Import Version

Asterisk 14 Application_MinivmAccMess

MinivmAccMess()

Synopsis
Record account specific messages.

Description
This application is part of the Mini-Voicemail system, configured in minivm.conf.

Use this application to record account specific audio/video messages for busy, unavailable and temporary messages.

Account specific directories will be created if they do not exist.

- MVM_ACCMESS_STATUS - This is the result of the attempt to record the specified greeting.
  FAILED is set if the file can't be created.
  - SUCCESS
  - FAILED

Syntax

MinivmAccMess(username@domain,[options])

Arguments

- mailbox
  - username - Voicemail username
  - domain - Voicemail domain
- options
  - u - Record the unavailable greeting.
  - b - Record the busy greeting.
  - t - Record the temporary greeting.
  - n - Account name.

Asterisk 14 Application_MinivmDelete

MinivmDelete()

Synopsis
Delete Mini-Voicemail voicemail messages.

Description
This application is part of the Mini-Voicemail system, configured in minivm.conf.
It deletes voicemail file set in MVM_FILENAME or given filename.

- MVM_DELETE_STATUS - This is the status of the delete operation.
  - SUCCESS
  - FAILED

Syntax
MinivmDelete(filename)

Arguments
- filename - File to delete

See Also

Asterisk 14 Application_MinivmGreet

**MinivmGreet()**

**Synopsis**

Play Mini-Voicemail prompts.

**Description**

This application is part of the Mini-Voicemail system, configured in minivm.conf. MinivmGreet() plays default prompts or user specific prompts for an account. Busy and unavailable messages can be chosen, but will be overridden if a temporary message exists for the account.

- **MVM_GREET_STATUS** - This is the status of the greeting playback.
  - SUCCESS
  - USEREXIT
  - FAILED

**Syntax**

```
MinivmGreet(username@domain,[options])
```

**Arguments**

- **mailbox**
  - **username** - Voicemail username
  - **domain** - Voicemail domain
- **options**
  - **b** - Play the busy greeting to the calling party.
  - **s** - Skip the playback of instructions for leaving a message to the calling party.
  - **u** - Play the unavailable greeting.

**See Also**

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MinivmMWI

MinivmMWI()

Synopsis
Send Message Waiting Notification to subscriber(s) of mailbox.

Description
This application is part of the Mini-Voicemail system, configured in minivm.conf.
MinivmMWI is used to send message waiting indication to any devices whose channels have subscribed to the mailbox passed in the first parameter.

Syntax

```
MinivmMWI(username@domain,urgent,new,old)
```

Arguments

- **mailbox**
  - **username** - Voicemail username
  - **domain** - Voicemail domain
- **urgent** - Number of urgent messages in mailbox.
- **new** - Number of new messages in mailbox.
- **old** - Number of old messages in mailbox.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MinivmNotify

MinivmNotify()

Synopsis

Notify voicemail owner about new messages.

Description

This application is part of the Mini-Voicemail system, configured in minivm.conf.

MiniVMnotify forwards messages about new voicemail to e-mail and pager. If there's no user account for that address, a temporary account will be used with default options (set in minivm.conf).

If the channel variable MVM_COUNTER is set, this will be used in the message file name and available in the template for the message.

If no template is given, the default email template will be used to send email and default pager template to send paging message (if the user account is configured with a paging address).

- **MVM_NOTIFY_STATUS** - This is the status of the notification attempt
  - SUCCESS
  - FAILED

Syntax

```
MinivmNotify(username@domain,[options])
```

Arguments

- **mailbox**
  - **username** - Voicemail username
  - **domain** - Voicemail domain
- **options**
  - **template** - E-mail template to use for voicemail notification

Asterisk 14 Application_MinivmRecord

MinivmRecord()

Synopsis
Receive Mini-Voicemail and forward via e-mail.

Description
This application is part of the Mini-Voicemail system, configured in minivm.conf
MiniVM records audio file in configured format and forwards message to e-mail and pager.
If there’s no user account for that address, a temporary account will be used with default options.
The recorded file name and path will be stored in MVM_FILENAME and the duration of the message will be stored in MVM_DURATION

```
Note
If the caller hangs up after the recording, the only way to send the message and clean up is to execute in the h extension. The application will exit if any of the following DTMF digits are received and the requested extension exist in the current context.
```

- **MVM_RECORD_STATUS** - This is the status of the record operation
  - SUCCESS
  - USEREXIT
  - FAILED

Syntax

```
MinivmRecord(username@domain,[options])
```

Arguments

- **mailbox**
  - **username** - Voicemail username
  - **domain** - Voicemail domain
- **options**
  - 0 - Jump to the 0 extension in the current dialplan context.
  - * - Jump to the a extension in the current dialplan context.
  - g - Use the specified amount of gain when recording the voicemail message. The units are whole-number decibels (dB).
  - gain - Amount of gain to use

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MixMonitor

MixMonitor()

Synopsis

Record a call and mix the audio during the recording. Use of StopMixMonitor is required to guarantee the audio file is available for processing during dialplan execution.

Description

Records the audio on the current channel to the specified file.

This application does not automatically answer and should be preceded by an application such as Answer or Progress().

Note

MixMonitor runs as an audiohook.

- MIXMONITOR_FILENAME - Will contain the filename used to record.

Syntax

MixMonitor(filename.extension,[options,[command]])

Arguments

- file
  - filename - If filename is an absolute path, uses that path, otherwise creates the file in the configured monitoring directory from asterisk.conf.
  - extension
- options
  - a - Append to the file instead of overwriting it.
  - b - Only save audio to the file while the channel is bridged.
  - B - Play a periodic beep while this call is being recorded.
    - interval - Interval, in seconds. Default is 15.
  - v - Adjust the heard volume by a factor of x (range -4 to 4)
    - x
  - V - Adjust the spoken volume by a factor of x (range -4 to 4)
    - x
  - W - Adjust both, heard and spoken volumes by a factor of x (range -4 to 4)
    - x
  - r - Use the specified file to record the receive audio feed. Like with the basic filename argument, if an absolute path isn't given, it will create the file in the configured monitoring directory.
    - file
  - t - Use the specified file to record the transmit audio feed. Like with the basic filename argument, if an absolute path isn't given, it will create the file in the configured monitoring directory.
    - file
  - i - Stores the MixMonitor's ID on this channel variable.
    - chanvar
  - p - Play a beep on the channel that starts the recording.
  - P - Play a beep on the channel that stops the recording.
  - m - Create a copy of the recording as a voicemail in the indicated mailbox(es) separated by commas eg. m(1111default,...). Folders can be optionally specified using the syntax: mailbox@context/folder
    - mailbox
- command - Will be executed when the recording is over.
  Any strings matching ^{X} will be unescaped to x.
  All variables will be evaluated at the time MixMonitor is called.

Asterisk 14 Application_Monitor

Monitor()

Synopsis
Monitor a channel.

Description
Used to start monitoring a channel. The channel's input and output voice packets are logged to files until the channel hangs up or monitoring is stopped by the StopMonitor application.

By default, files are stored to /var/spool/asterisk/monitor/. Returns -1 if monitor files can’t be opened or if the channel is already monitored, otherwise 0.

Syntax

Monitor(file_format:[urlbase],[fname_base,[options]])

Arguments

- file_format - optional, if not set, defaults to wav
- urlbase
- fname_base - if set, changes the filename used to the one specified.
- options
  - m - when the recording ends mix the two leg files into one and delete the two leg files. If the variable MONITOR_EXEC is set, the application referenced in it will be executed instead of soxmix/sox and the raw leg files will NOT be deleted automatically. soxmix/sox or MONITOR_EXEC is handed 3 arguments, the two leg files and a target mixed file name which is the same as the leg file names only without the in/out designator.
  - MONITOR_EXEC_ARGS is set, the contents will be passed on as additional arguments to MONITOR_EXEC. Both MONITOR_EXEC and the Mix flag can be set from the administrator interface.
  - b - Don’t begin recording unless a call is bridged to another channel.
  - B - Play a periodic beep while this call is being recorded.
    - interval - Interval, in seconds. Default is 15.
  - i - Skip recording of input stream (disables m option).
  - o - Skip recording of output stream (disables m option).

- Asterisk 14 Application_StopMonitor

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Morsecode

Morsecode()

Synopsis
Plays morse code.

Description
Plays the Morse code equivalent of the passed string.
This application does not automatically answer and should be preceeded by an application such as Answer() or Progress().

This application uses the following variables:
- MORSEDITLEN - Use this value in (ms) for length of dit
- MORSETONE - The pitch of the tone in (Hz), default is 800

Syntax
Morsecode(string)

Arguments
- string - String to playback as morse code to channel

See Also
- Asterisk 14 Application_SayAlpha
- Asterisk 14 Application_SayPhonetic

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MP3Player

MP3Player()

Synopsis
Play an MP3 file or M3U playlist file or stream.

Description
Executes mpg123 to play the given location, which typically would be a mp3 filename or m3u playlist filename or a URL. Please read http://en.wikipedia.org/wiki/M3U to see how M3U playlist file format is like. Example usage would be exten => 1234,1,MP3Player(/var/lib/asterisk/playlist.m3u) User can exit by pressing any key on the dialpad, or by hanging up.

This application does not automatically answer and should be preceded by an application such as Answer() or Progress().

Syntax

```
MP3Player(Location)
```

Arguments
- Location - Location of the file to be played. (argument passed to mpg123)

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MSet

MSet()

Synopsis

Set channel variable(s) or function value(s).

Description

This function can be used to set the value of channel variables or dialplan functions. When setting variables, if the variable name is prefixed with __, the variable will be inherited into channels created from the current channel. If the variable name is prefixed with ___, the variable will be inherited into channels created from the current channel and all children channels. MSet behaves in a similar fashion to the way Set worked in 1.2/1.4 and is thus prone to doing things that you may not expect. For example, it strips surrounding double-quotes from the right-hand side (value). If you need to put a separator character (comma or vert-bar), you will need to escape them by inserting a backslash before them. Avoid its use if possible.

Syntax

MSet(name1=value1,name2=value2)

Arguments

- set1
  - name1
  - value1
- set2
  - name2
  - value2

See Also

- Asterisk 14 Application_Set

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_MusicOnHold

MusicOnHold()

Synopsis

Play Music On Hold indefinitely.

Description

Plays hold music specified by class. If omitted, the default music source for the channel will be used. Change the default class with Set(CHANNEL(musicclass)=...). If duration is given, hold music will be played specified number of seconds. If duration is ommited, music plays indefinitely. Returns 0 when done, -1 on hangup.

This application does not automatically answer and should be preceded by an application such as Answer() or Progress().

Syntax

MusicOnHold(class, [duration])

Arguments

- class
- duration

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_NBScat

NBScat()

Synopsis
Play an NBS local stream.

Description
Executes nbscat to listen to the local NBS stream. User can exit by pressing any key.

Syntax

```plaintext
NBScat()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_NoCDR

NoCDR()

Synopsis
Tell Asterisk to not maintain a CDR for this channel.

Description
This application will tell Asterisk not to maintain a CDR for the current channel. This does NOT mean that information is not tracked; rather, if the channel is hung up no CDRs will be created for that channel.

If a subsequent call to ResetCDR occurs, all non-finalized CDRs created for the channel will be enabled.

Syntax

```
NoCDR()
```

Arguments
See Also

- Asterisk 14 Application_ResetCDR
- Asterisk 14 Function_CDR_PROP

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164

Note
This application is deprecated. Please use the CDR_PROP function to disable CDRs on a channel.
Asterisk 14 Application_NoOp

NoOp()

Synopsis
Do Nothing (No Operation).

Description
This application does nothing. However, it is useful for debugging purposes.
This method can be used to see the evaluations of variables or functions without having any effect.

Syntax

```
NoOp([text])
```

Arguments

- **text** - Any text provided can be viewed at the Asterisk CLI.

See Also

- Asterisk 14 Application_Verbose
- Asterisk 14 Application_Log

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ODBC_Commit

ODBC_Commit()

Synopsis
Commits a currently open database transaction.

Description
Commits the database transaction specified by transaction ID or the current active transaction, if not specified.

Syntax
```
ODBC_Commit([transaction ID])
```

Arguments
- transaction ID

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ODBC_Rollback

ODBC_Rollback()

Synopsis
Rollback a currently open database transaction.

Description
Rolls back the database transaction specified by transaction ID or the current active transaction, if not specified.

Syntax

```
ODBC_Rollback([transaction ID])
```

Arguments
- transaction ID

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ODBCFinish

ODBCFinish()

Synopsis
Clear the resultset of a successful multirow query.

Description
For queries which are marked as mode=multirow, this will clear any remaining rows of the specified resultset.

Syntax
```
ODBCFinish(result-id)
```

Arguments
- `result-id`

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Originate

Originate()

Synopsis

Originate a call.

Description

This application originates an outbound call and connects it to a specified extension or application. This application will block until the outgoing call fails or gets answered. At that point, this application will exit with the status variable set and dialplan processing will continue.

This application sets the following channel variable before exiting:

- ORIGINATE_STATUS - This indicates the result of the call origination.
  - FAILED
  - SUCCESS
  - BUSY
  - CONGESTION
  - HANGUP
  - RINGING
  - UNKNOWN - In practice, you should never see this value. Please report it to the issue tracker if you ever see it.

Syntax

```
Originate(tech_data, type, arg1, [arg2, [arg3, [timeout]]])
```

Arguments

- tech_data - Channel technology and data for creating the outbound channel. For example, SIP/1234.
- type - This should be app or exten, depending on whether the outbound channel should be connected to an application or extension.
- arg1 - If the type is app, then this is the application name. If the type is exten, then this is the context that the channel will be sent to.
- arg2 - If the type is app, then this is the data passed as arguments to the application. If the type is exten, then this is the extension that the channel will be sent to.
- arg3 - If the type is app, then this is the priority that the channel is sent to. If the type is exten, then this parameter is ignored.
- timeout - Timeout in seconds. Default is 30 seconds.

Asterisk 14 Application_OSPAuth

OSPAuth()

Synopsis

OSP Authentication.

Description

Authenticate a call by OSP.

Input variables:

- `OSPINPEERIP` - The last hop IP address.
- `OSPINTOKEN` - The inbound OSP token.

Output variables:

- `OSPINHANDLE` - The inbound call OSP transaction handle.
- `OSPINTIMELIMIT` - The inbound call duration limit in seconds.

This application sets the following channel variable upon completion:

- `OSPAUTHSTATUS` - The status of OSPAuth attempt as a text string, one of
  - SUCCESS
  - FAILED
  - ERROR

Syntax

```
OSPAuth([provider,[options]])
```

Arguments

- `provider` - The name of the provider that authenticates the call.
- `options` - Reserved.

See Also

- Asterisk 14 Application_OSPNext
- Asterisk 14 Application_OSPFinish

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_OSPFinish

OSPFinish()

Synopsis
Report OSP entry.

Description
Report call state.

Input variables:
- OSPINHANDLE - The inbound call OSP transaction handle.
- OSPOUTHANDLE - The outbound call OSP transaction handle.
- OSPAUTHSTATUS - The OSPAuth status.
- OSPLOOKUPSTATUS - The OSPLookup status.
- OSPNEXTSTATUS - The OSPNext status.
- OSPINAUDIOQOS - The inbound call leg audio QoS string.
- OSPOUTAUDIOQOS - The outbound call leg audio QoS string.

This application sets the following channel variable upon completion:
- OSPFINISHSTATUS - The status of the OSPFinish attempt as a text string, one of
  - SUCCESS
  - FAILED
  - ERROR

Syntax

```plaintext
OSPFinish([cause,[options]])
```

Arguments
- cause - Hangup cause.
- options - Reserved.

See Also
- Asterisk 14 Application_OSPAuth

Asterisk 14 Application_OSPLookup

OSPLookup()

Synopsis

Lookup destination by OSP.

Description

Looks up destination via OSP.

Input variables:

- OSPINACTUALSRC - The actual source device IP address in indirect mode.
- OSPINPEERIP - The last hop IP address.
- OSPINTECH - The inbound channel technology for the call.
- OSPINHANDLE - The inbound call OSP transaction handle.
- OSPINTIMELIMIT - The inbound call duration limit in seconds.
- OSPINNETWORKID - The inbound source network ID.
- OSPINNPRTN - The inbound routing number.
- OSPINNPCIC - The inbound carrier identification code.
- OSPINNPDI - The inbound number portability database dip indicator.
- OSPINSPI - The inbound service provider identity.
- OSPINOCN - The inbound operator company number.
- OSPINMCC - The inbound mobile country code.
- OSPINMNC - The inbound mobile network code.
- OSPINTOHOST - The inbound To header host part.
- OSPINRPIDUSER - The inbound Remote-Party-ID header user part.
- OSPINPAIUSER - The inbound P-Asserted-Identify header user part.
- OSPINDIVUSER - The inbound Diversion header user part.
- OSPINDIVHOST - The inbound Diversion header host part.
- OSPINPCUSER - The inbound P-Charge-Info header user part.
- OSPINCUSTOMINFO - The inbound custom information, where n is the index beginning with 1 upto 8.

Output variables:

- OSPOUTHANDLE - The outbound call OSP transaction handle.
- OSPOUTTECH - The outbound channel technology for the call.
- OSPDESTINATION - The outbound destination IP address.
- OSPOUTCALLING - The outbound calling number.
- OSPOUTNETWORK - The outbound destination network ID.
- OSPOUTNPRN - The outbound routing number.
- OSPOUTNPCIC - The outbound carrier identification code.
- OSPOUTNPDI - The outbound number portability database dip indicator.
- OSPOUTSPI - The outbound service provider identity.
- OSPOUTOCN - The outbound operator company number.
- OSPOUTNPC - The outbound service provider name.
- OSPOUTALTSPN - The outbound alternate service provider name.
- OSPOUTMCC - The outbound mobile country code.
- OSPOUTMNC - The outbound mobile network code.
- OSPOUTTOKEN - The outbound OSP token.
- OSPDESTREMAILS - The number of remained destinations.
- OSPOUTTIMELIMIT - The outbound call duration limit in seconds.
- OSPOUTCALLIDTYPES - The outbound Call-ID types.
- OSPOUTCALLID - The outbound Call-ID. Only for H.323.
- OSPDIALSTR - The outbound Dial command string.

This application sets the following channel variable upon completion:

- OSPLOOKUPSTATUS - The status of OSPLookup attempt as a text string, one of
  - SUCCESS
  - FAILED
  - ERROR

Syntax
OSPLookup(exten, [provider, [options]])

Arguments

- `exten` - The exten of the call.
- `provider` - The name of the provider that is used to route the call.
- `options`
  - `h` - generate H323 call id for the outbound call
  - `s` - generate SIP call id for the outbound call. Have not been implemented
  - `i` - generate IAX call id for the outbound call. Have not been implemented

OSPNext()

Synopsis

Lookup next destination by OSP.

Description

Looks up the next destination via OSP.

Input variables:

- OSPINHANDLE - The inbound call OSP transaction handle.
- OSPOUTHANDLE - The outbound call OSP transaction handle.
- OSPINTIMELIMIT - The inbound call duration limit in seconds.
- OSPOUTCALLIDTYPES - The outbound Call-ID types.
- OSPDESTEMLAILS - The number of remained destinations.

Output variables:

- OSPOUTTECH - The outbound channel technology.
- OSPDESTINATION - The destination IP address.
- OSPOUTCALLING - The outbound calling number.
- OSPOUTCALLED - The outbound called number.
- OSPOUTNETWORKID - The outbound destination network ID.
- OSPOUTNPAN - The outbound routing number.
- OSPOUTNPCIC - The outbound carrier identification code.
- OSPOUTNPDI - The outbound number portability database dip indicator.
- OSPOUTSPID - The outbound service provider identity.
- OSPOUTOCN - The outbound operator company number.
- OSPOUTSPN - The outbound service provider name.
- OSPOUTALTSPN - The outbound alternate service provider name.
- OSPOUTMCC - The outbound mobile country code.
- OSPOUTMNC - The outbound mobile network code.
- OSPOUTTOKEN - The outbound OSP token.
- OSPDESTEMLAILS - The number of remained destinations.
- OSPOUTTIMELIMIT - The outbound call duration limit in seconds.
- OSPOUTCALLID - The outbound Call-ID. Only for H.323.
- OSPDIALSTR - The outbound Dial command string.

This application sets the following channel variable upon completion:

- OSPNEXTSTATUS - The status of the OSPNext attempt as a text string, one of
  - SUCCESS
  - FAILED
  - ERROR

Syntax

**Asterisk 14 Application_Page**

**Page()**

**Synopsis**

Page series of phones

**Description**

Places outbound calls to the given technology/resource and dumps them into a conference bridge as muted participants. The original caller is dumped into the conference as a speaker and the room is destroyed when the original caller leaves.

**Syntax**

```
Page(Technology/Resource&[Technology2/Resource2&[&...]], [options,[timeout]])
```

**Arguments**

- **Technology/Resource**
  - Technology/Resource - Specification of the device(s) to dial. These must be in the format of Technology/Resource, where Technology represents a particular channel driver, and Resource represents a resource available to that particular channel driver.
  - Technology2/Resource2 - Optional extra devices to dial in parallel
    If you need more than one, enter them as Technology2/Resource2& Technology3/Resource3&....

- **options**
  - **b** - Before initiating an outgoing call, Gosub to the specified location using the newly created channel. The Gosub will be executed for each destination channel.
    - context
    - exten
    - priority
      - arg1
      - argN
  - **b** - Before initiating the outgoing call(s), Gosub to the specified location using the current channel.
    - context
    - exten
    - priority
      - arg1
      - argN
  - **d** - Full duplex audio
  - **i** - Ignore attempts to forward the call
  - **q** - Quiet, do not play beep to caller
  - **r** - Record the page into a file (CONFBRIDGE(bridge,record_conference))
  - **s** - Only dial a channel if its device state says that it is NOT_INUSE
  - **A** - Play an announcement to all paged participants
    - **x** - The announcement to playback to all devices
  - **n** - Do not play announcement to caller (alters A behavior)
  - **timeout** - Specify the length of time that the system will attempt to connect a call. After this duration, any page calls that have not been answered will be hung up by the system.

**See Also**

- **Asterisk 14 Application_ConfBridge**

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Park

Park()

Synopsis

Park yourself.

Description

Used to park yourself (typically in combination with an attended transfer to know the parking space).

If you set the PARKINGEXTEEN variable to a parking space extension in the parking lot, Park() will attempt to park the call on that extension. If the extension is already in use then execution will continue at the next priority.

If the parkeddynamic option is enabled in res_parking.conf the following variables can be used to dynamically create new parking lots. When using dynamic parking lots, be aware of the conditions as explained in the notes section below.

The PARKINGDYNAMIC variable specifies the parking lot to use as a template to create a dynamic parking lot. It is an error to specify a non-existent parking lot for the template. If not set then the default parking lot is used as the template.

The PARKINGDYNCONTEXT variable specifies the dialplan context to use for the newly created dynamic parking lot. If not set then the context from the parking lot template is used. The context is created if it does not already exist and the new parking lot needs to create extensions.

The PARKINGDYNEXTEN variable specifies the parkext to use for the newly created dynamic parking lot. If not set then the parkext is used from the parking lot template. If the template does not specify a parkext then no extensions are created for the newly created parking lot. The dynamic parking lot cannot be created if it needs to create extensions that overlap existing parking lot extensions. The only exception to this is for the parkext extension and only if neither of the overaping parking lot's parkext is exclusive.

The PARKINGDYNPOS variable specifies the parking positions to use for the newly created dynamic parking lot. If not set then the parkpos from the parking lot template is used.

Note

This application must be used as the first extension priority to be recognized as a parking access extension for blind transfers. Blind transfers and the DTMF one-touch parking feature need this distinction to operate properly. The parking access extension in this case is treated like a dialplan hint.

Syntax

Park([parking_lot_name,[options]])

Arguments

- parking_lot_name - Specify in which parking lot to park a call.
  - The parking lot used is selected in the following order:
    1) parking_lot_name option to this application
    2) PARKINGLOT variable
    3) CHANNEL(parkinglot) function (Possibly preset by the channel driver.)
    4) Default parking lot.
- options - A list of options for this parked call.
  - r - Send ringing instead of MOH to the parked call.
  - R - Randomize the selection of a parking space.
  - s - Silence announcement of the parking space number.
  - c - If the parking times out, go to this place in the dialplan instead of where the parking lot defines the call should go.
    - context
    - extension
    - priority
  - t - Use a timeout of duration seconds instead of the timeout specified by the parking lot.
    - duration

See Also

- Asterisk 14 Application_ParkedCall

Import Version

Asterisk 14 Application_ParkAndAnnounce

ParkAndAnnounce()

Synopsis
Park and Announce.

Description
Park a call into the parkinglot and announce the call to another channel.

The variable PARKEDAT will contain the parking extension into which the call was placed. Use with the Local channel to allow the dialplan to make use of this information.

Syntax

```
ParkAndAnnounce([parking_lot_name,[options,announce:announce1[...]],]dial)
```

Arguments
- **parking_lot_name** - Specify in which parking lot to park a call.
  The parking lot used is selected in the following order:
  1) parking_lot_name option to this application
  2) PARKINGLOT variable
  3) CHANNEL(parkinglot) function (Possibly preset by the channel driver.)
  4) Default parking lot.
- **options** - A list of options for this parked call.
  - **r** - Send ringing instead of MOH to the parked call.
  - **R** - Randomize the selection of a parking space.
  - **c** - If the parking times out, go to this place in the dialplan instead of where the parking lot defines the call should go.
    - **context**
    - **extension**
    - **priority**
  - **t** - Use a timeout of duration seconds instead of the timeout specified by the parking lot.
    - **duration**
- **announce_template**
  - **announce** - Colon-separated list of files to announce. The word PARKED will be replaced by a say_digits of the extension in which the call is parked.
  - **announce1**
- **dial** - The app_dial style resource to call to make the announcement. Console/dsp calls the console.

Asterisk 14 Application_ParkedCall

ParkedCall()

Synopsis
Retrieve a parked call.

Description
Used to retrieve a parked call from a parking lot.

Syntax
```
ParkedCall([parking_lot_name,[parking_space]])
```

Arguments
- `parking_lot_name` - Specify from which parking lot to retrieve a parked call.
  The parking lot used is selected in the following order:
  1) `parking_lot_name` option
  2) `PARKINGLOT variable`
  3) `CHANNEL(parkinglot)` function (Possibly preset by the channel driver.)
  4) Default parking lot.
- `parking_space` - Parking space to retrieve a parked call from. If not provided then the first available parked call in the parking lot will be retrieved.

Asterisk 14 Application_PauseMonitor

PauseMonitor()

Synopsis
Pause monitoring of a channel.

Description
Pauses monitoring of a channel until it is re-enabled by a call to UnpauseMonitor.

Syntax
```c
PauseMonitor()
```

Arguments

See Also
- Asterisk 14 Application_UnpauseMonitor

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_PauseQueueMember

PauseQueueMember()

Synopsis

Pauses a queue member.

Description

Pauses (blocks calls for) a queue member. The given interface will be paused in the given queue. This prevents any calls from being sent from the queue to the interface until it is unpause with UnpauseQueueMember or the manager interface. If no queuename is given, the interface is paused in every queue it is a member of. The application will fail if the interface is not found.

This application sets the following channel variable upon completion:

- **PQMSTATUS** - The status of the attempt to pause a queue member as a text string.
  - PAUSED
  - NOTFOUND

Example: PauseQueueMember(,SIP/3000)

Syntax

```
PauseQueueMember([queuename,interface,[options,[reason]]])
```

Arguments

- **queue name**
- **interface**
- **options**
- **reason** - Is used to add extra information to the appropriate queue_log entries and manager events.

Asterisk 14 Application_Pickup

Pickup()

Synopsis

Directed extension call pickup.

Description

This application can pickup a specified ringing channel. The channel to pickup can be specified in the following ways.

1) If no extension targets are specified, the application will pickup a channel matching the pickup group of the requesting channel.

2) If the extension is specified with a context of the special string PICKUPMARK (for example 10@PICKUPMARK), the application will pickup a channel which has defined the channel variable PICKUPMARK with the same value as extension (in this example, 10).

3) If the extension is specified with or without a context, the channel with a matching extension and context will be picked up. If no context is specified, the current context will be used.

Note

The extension is typically set on matching channels by the dial application that created the channel. The context is set on matching channels by the channel driver for the device.

Syntax

Pickup(extension1[extension2[&...]])

Arguments

- targets
  - extension - Specification of the pickup target.
    - extension
    - context
  - extension2 - Additional specifications of pickup targets.
    - extension2
    - context2

See Also

Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Application_PickupChan

PickupChan()

Synopsis
Pickup a ringing channel.

Description
Pickup a specified channel if ringing.

Syntax

```
PickupChan(channel1[channel2[&...]],[options])
```

Arguments
- channel - List of channel names or channel uniqueids to pickup if ringing. For example, a channel name could be SIP/bob or SIP/bob-00000000 to find SIP/bob-00000000.
- channel2
- options
  - p - Supplied channel names are prefixes. For example, SIP/bob will match SIP/bob-00000000 and SIP/bobby-00000000.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Playback

Playback()

Synopsis

Play a file.

Description

Plays back given filenames (do not put extension of wav/alaw etc). The playback command answer the channel if no options are specified. If the file is non-existant it will fail.

This application sets the following channel variable upon completion:

- PLAYBACKSTATUS - The status of the playback attempt as a text string.
  - SUCCESS
  - FAILED

See Also: Background (application) – for playing sound files that are interruptible
WaitExten (application) – wait for digits from caller, optionally play music on hold

Syntax

```
Playback(filename1[, filename2][,...],[options])
```

Arguments

- filenames
  - filename
  - filename2
- options - Comma separated list of options
  - skip - Do not play if not answered
  - noanswer - Playback without answering, otherwise the channel will be answered before the sound is played.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_PlayTones

PlayTones()

Synopsis

Play a tone list.

Description

Plays a tone list. Execution will continue with the next step in the dialplan immediately while the tones continue to play.

See the sample indications.conf for a description of the specification of a tonelist.

Syntax

```
PlayTones(arg)
```

Arguments

- **arg** - Arg is either the tone name defined in the indications.conf configuration file, or a directly specified list of frequencies and durations.

See Also

- Asterisk 14 Application_StopPlayTones

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_PrivacyManager

PrivacyManager()

Synopsis

Require phone number to be entered, if no CallerID sent

Description

If no CallerID is sent, PrivacyManager answers the channel and asks the caller to enter their phone number. The caller is given maxretries attempts to do so. The application does nothing if CallerID was received on the channel.

The application sets the following channel variable upon completion:

- PRIVACYMGRSTATUS - The status of the privacy manager’s attempt to collect a phone number from the user.
  - SUCCESS
  - FAILED

Syntax

PrivacyManager([maxretries,[minlength,[options,[context]]]])

Arguments

- maxretries - Total tries caller is allowed to input a callerid. Defaults to 3.
- minlength - Minimum allowable digits in the input callerid number. Defaults to 10.
- options - Position reserved for options.
- context - Context to check the given callerid against patterns.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Proceeding

Proceeding()

Synopsis
Indicate proceeding.

Description
This application will request that a proceeding message be provided to the calling channel.

Syntax

```
Proceeding()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Progress

Synopsis

Indicate progress.

Description

This application will request that in-band progress information be provided to the calling channel.

Syntax

```progress()
```

Arguments

See Also

- Asterisk 14 Application_Busy
- Asterisk 14 Application_Congestion
- Asterisk 14 Application_Ringing
- Asterisk 14 Application_Playtones

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Queue

Queue()

Synopsis
Queue a call for a call queue.

Description
In addition to transferring the call, a call may be parked and then picked up by another user.

This application will return to the dialplan if the queue does not exist, or any of the join options cause the caller to not enter the queue.

This application does not automatically answer and should be preceded by an application such as Answer(), Progress(), or Ringing().

This application sets the following channel variable upon completion:

- QUEUESTATUS - The status of the call as a text string.
  - TIMEOUT
  - FULL
  - JOINEMPTY
  - LEAVEEMPTY
  - JOINUNAVAIL
  - LEAVEUNAVAIL
  - CONTINUE

Syntax

```
Queue(queuename, [options, [URL, [announceoverride, [timeout, [AGI, [macro, [gosub, [rule, [position]]]]]]]])
```

Arguments

- queuename
- options
  - C - Mark all calls as "answered elsewhere" when cancelled.
  - c - Continue in the dialplan if the callee hangs up.
  - d - data-quality (modem) call (minimum delay).
  - F - When the caller hangs up, transfer the called member to the specified destination and start execution at that location.
    - context
    - exten
    - priority
  - f - When the caller hangs up, transfer the called member to the next priority of the current extension and start execution at that location.
  - h - Allow callee to hang up by pressing *.
  - H - Allow caller to hang up by pressing *.
  - n - No retries on the timeout; will exit this application and go to the next step.
  - i - Ignore call forward requests from queue members and do nothing when they are requested.
  - I - Asterisk will ignore any connected line update requests or any redirecting party update requests it may receive on this dial attempt.
  - r - Ring instead of playing MOH. Periodic Announcements are still made, if applicable.
  - R - Ring instead of playing MOH when a member channel is actually ringing.
  - t - Allow the called user to transfer the calling user.
  - T - Allow the calling user to transfer the call.
  - w - Allow the called user to write the conversation to disk via Monitor.
  - W - Allow the calling user to write the conversation to disk via Monitor.
  - K - Allow the called party to enable parking of the call by sending the DTMF sequence defined for call parking in features.conf.
  - k - Allow the calling party to enable parking of the call by sending the DTMF sequence defined for call parking in features.conf.
  - x - Allow the called user to write the conversation to disk via MixMonitor.
  - X - Allow the calling user to write the conversation to disk via MixMonitor.
- URL - URL will be sent to the called party if the channel supports it.
- announceoverride
- timeout - Will cause the queue to fail out after a specified number of seconds, checked between each queues.conf timeout and retry cycle.
- AGI - Will setup an AGI script to be executed on the calling party’s channel once they are connected to a queue member.
- macro - Will run a macro on the called party’s channel (the queue member) once the parties are connected.
• **gosub** - Will run a gosub on the called party's channel (the queue member) once the parties are connected.
• **rule** - Will cause the queue's default rule to be overridden by the rule specified.
• **position** - Attempt to enter the caller into the queue at the numerical position specified. 1 would attempt to enter the caller at the head of the queue, and 3 would attempt to place the caller third in the queue.

Asterisk 14 Application_QueueLog

QueueLog()

Synopsis

Writes to the queue_log file.

Description

Allows you to write your own events into the queue log.

Example: QueueLog(101,${UNIQUEID},${AGENT},WENTONBREAK,600)

Syntax

QueueLog(queuename,uniqueid,agent,event,[additionalinfo])

Arguments

- queuename
- uniqueid
- agent
- event
- additionalinfo

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_RaiseException

RaiseException()

Synopsis
Handle an exceptional condition.

Description
This application will jump to the e extension in the current context, setting the dialplan function EXCEPTION(). If the e extension does not exist, the call will hangup.

Syntax
```
RaiseException(reason)
```

Arguments
- reason

See Also
- Asterisk 14 Function_Exception

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Read

Read()

Synopsis
Read a variable.

Description
Reads a #-terminated string of digits a certain number of times from the user in to the given variable. This application sets the following channel variable upon completion:

- **READSTATUS** - This is the status of the read operation.
  - OK
  - ERROR
  - HANGUP
  - INTERRUPTED
  - SKIPPED
  - TIMEOUT

Syntax

```
Read(variable,filenames[filename2[...]],[maxdigits,[options,[attempts,[timeout]]]]})
```

Arguments

- **variable** - The input digits will be stored in the given variable name.
- **filenames**
  - **filename** - file(s) to play before reading digits or tone with option i
  - **filename2**
- **maxdigits** - Maximum acceptable number of digits. Stops reading after maxdigits have been entered (without requiring the user to press the # key).
  - Defaults to 0 - no limit - wait for the user press the # key. Any value below 0 means the same. Max accepted value is 255.
- **options**
  - **s** - to return immediately if the line is not up.
  - **i** - to play filename as an indication tone from your indications.conf.
  - **n** - to read digits even if the line is not up.
- **attempts** - If greater than 1, that many attempts will be made in the event no data is entered.
- **timeout** - The number of seconds to wait for a digit response. If greater than 0, that value will override the default timeout. Can be floating point.

See Also

- Asterisk 14 Application_SendDTMF

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ReadExten

ReadExten()

Synopsis

Read an extension into a variable.

Description

Reads a \# terminated string of digits from the user into the given variable. Will set READEXTENSTATUS on exit with one of the following statuses:

- READEXTENSTATUS
  - OK - A valid extension exists in \${variable}.
  - TIMEOUT - No extension was entered in the specified time. Also sets \${variable} to "t".
  - INVALID - An invalid extension, \${INVALID_EXTEN}, was entered. Also sets \${variable} to "i".
  - SKIP - Line was not up and the option 's' was specified.
  - ERROR - Invalid arguments were passed.

Syntax

```plaintext
ReadExten(variable,[filename,[context,[option,[timeout]]]])
```

Arguments

- variable
- filename - File to play before reading digits or tone with option i
- context - Context in which to match extensions.
- option
  - s - Return immediately if the channel is not answered.
  - i - Play filename as an indication tone from your indications.conf or a directly specified list of frequencies and durations.
  - n - Read digits even if the channel is not answered.
- timeout - An integer number of seconds to wait for a digit response. If greater than 0, that value will override the default timeout.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ReceiveFAX_app_fax

ReceiveFAX() - [app_fax]

Synopsis
Receive a Fax

Description
Receives a FAX from the channel into the given filename overwriting the file if it already exists.
File created will be in TIFF format.
This application sets the following channel variables:

- LOCALSTATIONID - To identify itself to the remote end
- LOCALHEADERINFO - To generate a header line on each page
- FAXSTATUS
  - SUCCESS
  - FAILED
- FAXERROR - Cause of failure
- REMOTESTATIONID - The CSID of the remote side
- FAXPAGES - Number of pages sent
- FAXBITRATE - Transmission rate
- FAXRESOLUTION - Resolution of sent fax

Syntax

```
ReceiveFAX(filename[,c])
```

Arguments

- filename - Filename of TIFF file save incoming fax
- c - Makes the application behave as the calling machine
  (Default behavior is as answering machine)

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ReceiveFAX_res_fax

ReceiveFAX() - [res_fax]

Synopsis
Receive a FAX and save as a TIFF/F file.

Description
This application is provided by res_fax, which is a FAX technology agnostic module that utilizes FAX technology resource modules to complete a FAX transmission.
Session arguments can be set by the FAXOPT function and to check results of the ReceiveFax() application.

Syntax

```
ReceiveFAX(filename,[options])
```

Arguments

- `filename`
- `options`
  - `d` - Enable FAX debugging.
  - `f` - Allow audio fallback FAX transfer on T.38 capable channels.
  - `F` - Force usage of audio mode on T.38 capable channels.
  - `s` - Send progress Manager events (overrides statusevents setting in res_fax.conf).

See Also

- Asterisk 14 Function_FAXOPT

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Record

Record()

Synopsis
Record to a file.

Description
If filename contains \d, these characters will be replaced with a number incremented by one each time the file is recorded. Use core show file formats to see the available formats on your system User can press # to terminate the recording and continue to the next priority. If the user hangs up during a recording, all data will be lost and the application will terminate.

- **RECORDED_FILE** - Will be set to the final filename of the recording.
- **RECORD_STATUS** - This is the final status of the command
  - DTMF - A terminating DTMF was received ("#" or ",", depending upon option 't')
  - SILENCE - The maximum silence occurred in the recording.
  - SKIP - The line was not yet answered and the 's' option was specified.
  - TIMEOUT - The maximum length was reached.
  - HANGUP - The channel was hung up.
  - ERROR - An unrecoverable error occurred, which resulted in a WARNING to the logs.

Syntax

```
Record(filename.format,[silence,[maxduration,[options]]])
```

Arguments

- **filename**
  - *filename*
    - format - Is the format of the file type to be recorded (wav, gsm, etc).
  - silence - Is the number of seconds of silence to allow before returning.
  - maxduration - Is the maximum recording duration in seconds. If missing or 0 there is no maximum.
  - options
    - a - Append to existing recording rather than replacing.
    - n - Do not answer, but record anyway if line not yet answered.
    - o - Exit when 0 is pressed, setting the variable RECORD_STATUS to OPERATOR instead of DTMF
    - q - quiet (do not play a beep tone).
    - s - Skip recording if the line is not yet answered.
    - t - use alternate "" terminator key (DTMF) instead of default '#'
    - x - Ignore all terminator keys (DTMF) and keep recording until hangup.
    - k - Keep recorded file upon hangup.
    - y - Terminate recording if any DTMF digit is received.

Asterisk 14 Application_RemoveQueueMember

RemoveQueueMember()

Synopsis
Dynamically removes queue members.

Description
If the interface is NOT in the queue it will return an error.

This application sets the following channel variable upon completion:

- RQMSTATUS
  - REMOVED
  - NOTINQUEUE
  - NOSUCHQUEUE
  - NOTDYNAMIC

Example: RemoveQueueMember(techsupport,SIP/3000)

Syntax

```
RemoveQueueMember(queuename,[interface])
```

Arguments

- queuename
- interface

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_ResetCDR

ResetCDR()

Synopsis

Resets the Call Data Record.

Description

This application causes the Call Data Record to be reset. Depending on the flags passed in, this can have several effects. With no options, a reset does the following:

1. The start time is set to the current time.

2. If the channel is answered, the answer time is set to the current time.

3. All variables are wiped from the CDR. Note that this step can be prevented with the v option.

On the other hand, if the e option is specified, the effects of the NoCDR application will be lifted. CDRs will be re-enabled for this channel.

Note

The e option is deprecated. Please use the CDR_PROP function instead.

Syntax

ResetCDR([options])

Arguments

- **options**
  - v - Save the CDR variables during the reset.
  - e - Enable the CDRs for this channel only (negate effects of NoCDR).

See Also

- Asterisk 14 Application_ForkCDR
- Asterisk 14 Application_NoCDR
- Asterisk 14 Function_CDR_PROP

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_RetryDial

RetryDial()

Synopsis

Place a call, retrying on failure allowing an optional exit extension.

Description

This application will attempt to place a call using the normal Dial application. If no channel can be reached, the announce file will be played. Then, it will wait sleep number of seconds before retrying the call. After retries number of attempts, the calling channel will continue at the next priority in the dialplan. If the retries setting is set to 0, this application will retry endlessly. While waiting to retry a call, a 1 digit extension may be dialed. If that extension exists in either the context defined in EXITCONTEXT or the current one, The call will jump to that extension immediately. The dialargs are specified in the same format that arguments are provided to the Dial application.

Syntax

RetryDial(announce,sleep,retries,dialargs)

Arguments

- announce - Filename of sound that will be played when no channel can be reached
- sleep - Number of seconds to wait after a dial attempt failed before a new attempt is made
- retries - Number of retries
  - When this is reached flow will continue at the next priority in the dialplan
- dialargs - Same format as arguments provided to the Dial application

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Return

Return()

Synopsis
Return from gosub routine.

Description
Jumps to the last label on the stack, removing it. The return value, if any, is saved in the channel variable GOSUB_RETVAL.

Syntax
Return([value])

Arguments
- value - Return value.

See Also
- Asterisk 14 Application_Gosub
- Asterisk 14 Application_StackPop

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Ringing

Ringing()

Synopsis
Indicate ringing tone.

Description
This application will request that the channel indicate a ringing tone to the user.

Syntax

```
Ringing()
```

Arguments

See Also

- Asterisk 14 Application_Busy
- Asterisk 14 Application_Congestion
- Asterisk 14 Application_Progress
- Asterisk 14 Application_Playtones

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayAlpha

SayAlpha()

Synopsis
Say Alpha.

Description
This application will play the sounds that correspond to the letters of the given string. If the channel variable SAY_DTMF_INTERRUPT is set to 'true' (case insensitive), then this application will react to DTMF in the same way as Background.

Syntax
SayAlpha(string)

Arguments
- string

See Also
- Asterisk 14 Application_SayDigits
- Asterisk 14 Application_SayNumber
- Asterisk 14 Application_SayPhonetic
- Asterisk 14 Function_CHANNEL

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayAlphaCase

SayAlphaCase()

Synopsis
Say Alpha.

Description
This application will play the sounds that correspond to the letters of the given string. Optionally, a casetype may be specified. This will be used for case-insensitive or case-sensitive pronunciations. If the channel variable SAY_DTMF_INTERRUPT is set to 'true' (case insensitive), then this application will react to DTMF in the same way as Background.

Syntax

```
SayAlphaCase(casetype,string)
```

Arguments

- **casetype**
  - a - Case sensitive (all) pronunciation. (Ex: SayAlphaCase(a,aBc); - lowercase a uppercase b lowercase c).
  - l - Case sensitive (lower) pronunciation. (Ex: SayAlphaCase(l,aBc); - lowercase a b lowercase c).
  - n - Case insensitive pronunciation. Equivalent to SayAlpha. (Ex: SayAlphaCase(n,aBc) - a b c).
  - u - Case sensitive (upper) pronunciation. (Ex: SayAlphaCase(u,aBc); - a uppercase b c).
- **string**

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayCountedAdj

SayCountedAdj()

Synopsis

Say a adjective in declined form in order to count things

Description

Selects and plays the proper form of an adjective according to the gender and of the noun it modifies and the number of objects named by the noun-verb combination which have been counted. Used when saying things such as "5 new messages". The various singular and plural forms of the adjective are selected by adding suffixes to filename.

If the channel language is English, then no suffix will ever be added (since, in English, adjectives are not declined). If the channel language is Russian or some other Slavic language, then the suffix will the specified gender for nominative, and "x" for genative plural. (The genative singular is not used when counting things.) For example, SayCountedAdj(1,new,f) will play sound file "newa" (containing the word "novaya"), but SayCountedAdj(5,new,f) will play sound file "newx" (containing the word "novikh").

This application does not automatically answer and should be preceded by an application such as Answer(), Progress(), or Proceeding().

Syntax

```
SayCountedAdj(number,filename,[gender])
```

Arguments

- number - The number of things
- filename - File name stem for the adjective
- gender - The gender of the noun modified, one of 'm', 'f', 'n', or 'c'

See Also

- Asterisk 14 Application_SayCountedNoun
- Asterisk 14 Application_SayNumber

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayCountedNoun

SayCountedNoun()

Synopsis

Say a noun in declined form in order to count things

Description

Selects and plays the proper singular or plural form of a noun when saying things such as "five calls". English has simple rules for deciding when to say "call" and when to say "calls", but other languages have complicated rules which would be extremely difficult to implement in the Asterisk dialplan language.

The correct sound file is selected by examining the number and adding the appropriate suffix to filename. If the channel language is English, then the suffix will be either empty or "s". If the channel language is Russian or some other Slavic language, then the suffix will be empty for nominative, "x1" for genative singular, and "x2" for genative plural.

Note that combining filename with a suffix will not necessarily produce a correctly spelled plural form. For example, SayCountedNoun(2,man) will play the sound file "mans" rather than "men". This behavior is intentional. Since the file name is never seen by the end user, there is no need to implement complicated spelling rules. We simply record the word "men" in the sound file named "mans".

This application does not automatically answer and should be preceded by an application such as Answer() or Progress.

Syntax

```
SayCountedNoun(number, filename)
```

Arguments

- number - The number of things
- filename - File name stem for the noun that is the name of the things

See Also

- Asterisk 14 Application_SayCountedAdj
- Asterisk 14 Application_SayNumber

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayDigits

SayDigits()

Synopsis
Say Digits.

Description
This application will play the sounds that correspond to the digits of the given number. This will use the language that is currently set for the channel. If the channel variable `SAY_DTMF_INTERRUPT` is set to 'true' (case insensitive), then this application will react to DTMF in the same way.

Background

Syntax

```plaintext
SayDigits(digits)
```

Arguments

- `digits`

See Also

- Asterisk 14 Application_SayAlpha
- Asterisk 14 Application_SayNumber
- Asterisk 14 Application_SayPhonetic
- Asterisk 14 Function_CHANNEL

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayNumber

SayNumber()

Synopsis

Say Number.

Description

This application will play the sounds that correspond to the given digits. Optionally, a gender may be specified. This will use the language that is currently set for the channel. See the CHANNEL() function for more information on setting the language for the channel. If the channel variable SAY_DTMF_INTERRUPT is set to 'true' (case insensitive), then this application will react to DTMF in the same way as Background.

Syntax

```
SayNumber(digits, [gender])
```

Arguments

- digits
- gender

See Also

- Asterisk 14 Application_SayAlpha

Asterisk 14 Application_SayPhonetic

SayPhonetic()

Synopsis

Say Phonetic.

Description

This application will play the sounds from the phonetic alphabet that correspond to the letters in the given string. If the channel variable SAY_DTMF_INTER RUPT is set to 'true' (case insensitive), then this application will react to DTMF in the same way as Background.

Syntax

SayPhonetic(string)

Arguments

• string

See Also

• Asterisk 14 Application_SayAlpha
• Asterisk 14 Application_SayDigits
• Asterisk 14 Application_SayNumber

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SayUnixTime

SayUnixTime()

Synopsis
Says a specified time in a custom format.

Description
Uses some of the sound files stored in /var/lib/asterisk/sounds to construct a phrase saying the specified date and/or time in the specified format.

Syntax

```
SayUnixTime([unixtime,[timezone,[format,[options]]]])
```

Arguments

- **unixtime** - time, in seconds since Jan 1, 1970. May be negative. Defaults to now.
- **timezone** - timezone, see /usr/share/zoneinfo for a list. Defaults to machine default.
- **format** - a format the time is to be said in. See voicemail.conf. Defaults to ABdY "digits/at" IMp
- **options**
  - **j** - Allow the calling user to dial digits to jump to that extension. This option is automatically enabled if SAY_DTMF_INTERRUPT is present on the channel and set to 'true' (case insensitive)

- Asterisk 14 Function_IFTIME

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SendDTMF

SendDTMF()

Synopsis
Sends arbitrary DTMF digits

Description
It will send all digits or terminate if it encounters an error.

Syntax

```
SendDTMF(digits, [timeout_ms, [duration_ms, [channel]]])
```

Arguments
- `digits` - List of digits 0-9,*#,a-d,A-D to send also w for a half second pause, W for a one second pause, and f or F for a flash-hook if the channel supports flash-hook.
- `timeout_ms` - Amount of time to wait in ms between tones. (defaults to .25s)
- `duration_ms` - Duration of each digit
- `channel` - Channel where digits will be played

- Asterisk 14 Application_Read

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SendFAX_app_fax

SendFAX() - [app_fax]

Synopsis
Send a Fax

Description
Send a given TIFF file to the channel as a FAX.

This application sets the following channel variables:

- LOCALSTATIONID - To identify itself to the remote end
- LOCALHEADERINFO - To generate a header line on each page
- FAXSTATUS
  - SUCCESS
  - FAILED
- FAXERROR - Cause of failure
- REMOTESTATIONID - The CSID of the remote side
- FAXPAGES - Number of pages sent
- FAXBITRATE - Transmission rate
- FAXRESOLUTION - Resolution of sent fax

Syntax

SendFAX(filename,[a])

Arguments

- filename - Filename of TIFF file to fax
- a - Makes the application behave as the answering machine
  (Default behavior is as calling machine)

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SendFAX_res_fax

SendFAX() - [res_fax]

Synopsis

Sends a specified TIFF/F file as a FAX.

Description

This application is provided by res_fax, which is a FAX technology agnostic module that utilizes FAX technology resource modules to complete a FAX transmission.

Session arguments can be set by the FAXOPT function and to check results of the SendFax() application.

Syntax

```plaintext
SendFAX([filename2[&...]],[options])
```

Arguments

- **filename**
  - `filename2` - TIFF file to send as a FAX.
- **options**
  - `d` - Enable FAX debugging.
  - `f` - Allow audio fallback FAX transfer on T.38 capable channels.
  - `F` - Force usage of audio mode on T.38 capable channels.
  - `s` - Send progress Manager events (overrides statusevents setting in res_fax.conf).
  - `z` - Initiate a T.38 reinvite on the channel if the remote end does not.

See Also

- Asterisk 14 Function_FAXOPT

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SendImage

SendImage()

Synopsis
Sends an image file.

Description
Send an image file on a channel supporting it.
Result of transmission will be stored in SENDIMAGESTATUS

- SENDIMAGESTATUS
  - SUCCESS - Transmission succeeded.
  - FAILURE - Transmission failed.
  - UNSUPPORTED - Image transmission not supported by channel.

Syntax

```
SendImage(filename)
```

Arguments

- `filename` - Path of the filename (image) to send.

See Also

- Asterisk 14 Application_SendText
- Asterisk 14 Application_SendURL

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SendText

SendText()

Synopsis

Send a Text Message.

Description

Sends text to current channel (callee).

Result of transmission will be stored in the SENDTEXTSTATUS

- SUCCESS - Transmission succeeded.
- FAILURE - Transmission failed.
- UNSUPPORTED - Text transmission not supported by channel.

Syntax

SendText(text)

Arguments

- text

See Also

- Asterisk 14 Application_SendImage
- Asterisk 14 Application_SendURL

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164

Note

At this moment, text is supposed to be 7 bit ASCII in most channels.
Asterisk 14 Application_SendURL

SendURL()

Synopsis
Send a URL.

Description
Requests client go to URL (IAX2) or sends the URL to the client (other channels).

Result is returned in the SENDURLSTATUS channel variable:

- **SUCCESS** - URL successfully sent to client.
- **FAILURE** - Failed to send URL.
- **NOLOAD** - Client failed to load URL (wait enabled).
- **UNSUPPORTED** - Channel does not support URL transport.

SendURL continues normally if the URL was sent correctly or if the channel does not support HTML transport. Otherwise, the channel is hung up.

Syntax

```
SendURL(URL,[option])
```

Arguments

- **URL**
- **option**
  - **w** - Execution will wait for an acknowledgement that the URL has been loaded before continuing.

See Also

- Asterisk 14 Application_SendImage
- Asterisk 14 Application_SendText

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Set

Set()

Synopsis

Set channel variable or function value.

Description

This function can be used to set the value of channel variables or dialplan functions. When setting variables, if the variable name is prefixed with \_, the variable will be inherited into channels created from the current channel. If the variable name is prefixed with \__, the variable will be inherited into channels created from the current channel and all children channels.

Syntax

Set(name=value)

Arguments

- name
- value

See Also

- Asterisk 14 Application_MSet
- Asterisk 14 Function_GLOBAL
- Asterisk 14 Function_SET
- Asterisk 14 Function_ENV

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SetAMAFlags

SetAMAFlags()

Synopsis
Set the AMA Flags.

Description
This application will set the channel's AMA Flags for billing purposes.

⚠️ Warning
This application is deprecated. Please use the CHANNEL function instead.

Syntax

SetAMAFlags(\{flag\})

Arguments
- flag

See Also
- Asterisk 14 Function_CDR
- Asterisk 14 Function_CHANNEL

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SetCallerPres

SetCallerPres()

Synopsis
Set CallerID Presentation.

Description
Set CallerID presentation on a call.

Syntax

```
SetCallerPres(presentation)
```

Arguments

- presentation
  - allowed_not_screened - Presentation Allowed, Not Screened.
  - allowed_passed_screen - Presentation Allowed, Passed Screen.
  - allowed_failed_screen - Presentation Allowed, Failed Screen.
  - allowed - Presentation Allowed, Network Number.
  - prohib_not_screened - Presentation Prohibited, Not Screened.
  - prohib_passed_screen - Presentation Prohibited, Passed Screen.
  - prohib_failed_screen - Presentation Prohibited, Failed Screen.
  - prohib - Presentation Prohibited, Network Number.
  - unavailable - Number Unavailable.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SIPAddHeader

SIPAddHeader()

Synopsis

Add a SIP header to the outbound call.

Description

Adds a header to a SIP call placed with DIAL.

Remember to use the X-header if you are adding non-standard SIP headers, like `X-Asterisk-Accountcode`. Use this with care. Adding the wrong headers may jeopardize the SIP dialog.

Always returns 0.

Syntax

```
SIPAddHeader(Header:Content)
```

Arguments

- **Header**
- **Content**

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SIPDtmfMode

SIPDtmfMode()

Synopsis
Change the dtmfmode for a SIP call.

Description
Changes the dtmfmode for a SIP call.

Syntax
SIPDtmfMode(mode)

Arguments
- mode
  - inband
  - info
  - rfc2833

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application SIPRemoveHeader

SIPRemoveHeader()

Synopsis

Remove SIP headers previously added with SIPAddHeader

Description

SIPRemoveHeader() allows you to remove headers which were previously added with SIPAddHeader(). If no parameter is supplied, all previously added headers will be removed. If a parameter is supplied, only the matching headers will be removed.

For example you have added these 2 headers:

SIPAddHeader(P-Asserted-Identity: sip:foo@bar);
SIPAddHeader(P-Preferred-Identity: sip:bar@foo);

// remove all headers
SIPRemoveHeader();

// remove all P- headers
SIPRemoveHeader(P-);

// remove only the PAI header (note the : at the end)
SIPRemoveHeader(P-Asserted-Identity:);

Always returns 0.

Syntax

SIPRemoveHeader([Header])

Arguments

- Header

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SIPSendCustomINFO

SIPSendCustomINFO()

Synopsis

Send a custom INFO frame on specified channels.

Description

SIPSendCustomINFO() allows you to send a custom INFO message on all active SIP channels or on channels with the specified User Agent. This application is only available if TEST_FRAMEWORK is defined.

Syntax

```
SIPSendCustomINFO(Data,[UserAgent])
```

Arguments

- Data
- UserAgent

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SkelGuessNumber

SkelGuessNumber()

Synopsis
An example number guessing game

Description
This simple number guessing application is a template to build other applications from. It shows you the basic structure to create your own Asterisk applications.

Syntax

```
SkelGuessNumber(level,[options])
```

Arguments

- level
- options
  - c - The computer should cheat
  - n - How many games to play before hanging up

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SLAStation

SLAStation()

Synopsis

Shared Line Appearance Station.

Description

This application should be executed by an SLA station. The argument depends on how the call was initiated. If the phone was just taken off hook, then the argument station should be just the station name. If the call was initiated by pressing a line key, then the station name should be preceded by an underscore and the trunk name associated with that line button.

For example: station1_line1

On exit, this application will set the variable SLASTATION_STATUS to one of the following values:

- SLASTATION_STATUS
  - FAILURE
  - CONGESTION
  - SUCCESS

Syntax

```
SLAStation(station)
```

Arguments

- station - Station name

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SLATrunk

SLATrunk()

Synopsis

Shared Line Appearance Trunk.

Description

This application should be executed by an SLA trunk on an inbound call. The channel calling this application should correspond to the SLA trunk with the name trunk that is being passed as an argument.

On exit, this application will set the variable SLATRUNK_STATUS to one of the following values:

- SLATRUNK_STATUS
- FAILURE
- SUCCESS
- UNANSWERED
- RINGTIMEOUT

Syntax

SLATrunk(trunk,[options])

Arguments

- trunk - Trunk name
- options
  - M - Play back the specified MOH class instead of ringing
    - class

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SMS

SMS()

Synopsis

Communicates with SMS service centres and SMS capable analogue phones.

Description

SMS handles exchange of SMS data with a call to/from SMS capable phone or SMS PSTN service center. Can send and/or receive SMS messages. Works to ETSI ES 201 912; compatible with BT SMS PSTN service in UK and Telecom Italia in Italy.

Typical usage is to use to handle calls from the SMS service centre CLI, or to set up a call using outgoing or manager interface to connect service centre to SMS().

*Messages are processed as per text file message queues. smsq (a separate software) is a command to generate message queues and send messages.

Note

The protocol has tight delay bounds. Please use short frames and disable/keep short the jitter buffer on the ATA to make sure that responses (ACK etc.) are received in time.

Syntax

```plaintext
SMS(name,[options,[addr,[body]]])
```

Arguments

- name - The name of the queue used in `/var/spool/asterisk/sms`
- options
  - a - Answer, i.e. send initial FSK packet.
  - s - Act as service centre talking to a phone.
  - t - Use protocol 2 (default used is protocol 1).
  - p - Set the initial delay to N ms (default is 300). addr and body are a deprecated format to send messages out.
  - r - Set the Status Report Request (SRR) bit.
  - o - The body should be coded as octets not 7-bit symbols.
  - n - Do not log any SMS content to log file (privacy).
- addr
- body

Asterisk 14 Application_SoftHangup

SoftHangup()

Synopsis
Hangs up the requested channel.

Description
Hangs up the requested channel. If there are no channels to hangup, the application will report it.

Syntax
```
SoftHangup(Technology/Resource,[options])
```

Arguments
- **Technology/Resource**
- **options**
  - a - Hang up all channels on a specified device instead of a single resource

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechActivateGrammar

SpeechActivateGrammar()

Synopsis
Activate a grammar.

Description
This activates the specified grammar to be recognized by the engine. A grammar tells the speech recognition engine what to recognize, and how to portray it back to you in the dialplan. The grammar name is the only argument to this application.

Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

```
SpeechActivateGrammar(grammar_name)
```

Arguments

- `grammar_name`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechBackground

SpeechBackground()

Synopsis

Play a sound file and wait for speech to be recognized.

Description

This application plays a sound file and waits for the person to speak. Once they start speaking playback of the file stops, and silence is heard. Once they stop talking the processing sound is played to indicate the speech recognition engine is working. Once results are available the application returns and results (score and text) are available using dialplan functions.

The first text and score are \${SPEECH_TEXT(0)} AND \${SPEECH_SCORE(0)} while the second are \${SPEECH_TEXT(1)} and \${SPEECH_SCORE(1)}.

The first argument is the sound file and the second is the timeout integer in seconds.

Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

SpeechBackground(sound_file,[timeout,[options]])

Arguments

- sound_file
- timeout - Timeout integer in seconds. Note the timeout will only start once the sound file has stopped playing.
- options
  - n - Don't answer the channel if it has not already been answered.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechCreate

SpeechCreate()

Synopsis
Create a Speech Structure.

Description
This application creates information to be used by all the other applications. It must be called before doing any speech recognition activities such as activating a grammar. It takes the engine name to use as the argument, if not specified the default engine will be used.

Sets the ERROR channel variable to 1 if the engine cannot be used.

Syntax

```
SpeechCreate(engine_name)
```

Arguments

* engine_name

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechDeactivateGrammar

SpeechDeactivateGrammar()

Synopsis
Deactivate a grammar.

Description
This deactivates the specified grammar so that it is no longer recognized.
Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

`SpeechDeactivateGrammar(grammar_name)`

Arguments

- `grammar_name` - The grammar name to deactivate

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechDestroy

SpeechDestroy()

Synopsis

End speech recognition.

Description

This destroys the information used by all the other speech recognition applications. If you call this application but end up wanting to recognize more speech, you must call SpeechCreate() again before calling any other application.

Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

```c
SpeechDestroy()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechLoadGrammar

SpeechLoadGrammar()

Synopsis
Load a grammar.

Description
Load a grammar only on the channel, not globally.
Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

```
SpeechLoadGrammar(grammar_name, path)
```

Arguments

- `grammar_name`
- `path`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechProcessingSound

SpeechProcessingSound()

Synopsis
Change background processing sound.

Description
This changes the processing sound that SpeechBackground plays back when the speech recognition engine is processing and working to get results. Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

```plaintext
SpeechProcessingSound(sound_file)
```

Arguments
- `sound_file`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechStart

SpeechStart()

Synopsis
Start recognizing voice in the audio stream.

Description
Tell the speech recognition engine that it should start trying to get results from audio being fed to it.
Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

```c
SpeechStart()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_SpeechUnloadGrammar

SpeechUnloadGrammar()

Synopsis
Unload a grammar.

Description
Unload a grammar.
Hangs up the channel on failure. If this is not desired, use TryExec.

Syntax

```
SpeechUnloadGrammar(grammar_name)
```

Arguments
- `grammar_name`

See Also

Import Version

Asterisk 14 Application_StackPop

StackPop()

Synopsis
Remove one address from gosub stack.

Description
Removes last label on the stack, discarding it.

Syntax

```
StackPop()
```

Arguments

See Also

- Asterisk 14 Application_Return
- Asterisk 14 Application_Gosub

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_StartMusicOnHold

StartMusicOnHold()

Synopsis

Play Music On Hold.

Description

Starts playing music on hold, uses default music class for channel. Starts playing music specified by class. If omitted, the default music source for the channel will be used. Always returns 0.

Syntax

```
StartMusicOnHold(class)
```

Arguments

- `class`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Stasis

Stasis()

Synopsis
Invoke an external Stasis application.

Description
Invoke a Stasis application.

This application will set the following channel variable upon completion:

- **STASISSTATUS**: This indicates the status of the execution of the Stasis application.
  - SUCCESS: The channel has exited Stasis without any failures in Stasis.
  - FAILED: A failure occurred when executing the Stasis application. Some (not all) possible reasons for this: requested is not registered; The app requested is not active; Stasis couldn't send a start message.

Syntax

```
Stasis(app_name, [args])
```

Arguments

- **app_name**: Name of the application to invoke.
- **args**: Optional comma-delimited arguments for the application invocation.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_StatsD

StatsD()

Synopsis
Allow statistics to be passed to the StatsD server from the dialplan.

Description
This dialplan application sends statistics to the StatsD server specified inside of statsd.conf.

Syntax

StatsD(metric_type,statistic_name,value,[sample_rate])

Arguments
- metric_type - The metric type to be sent to StatsD. Valid metric types are 'g' for gauge, 'c' for counter, 'ms' for timer, and 's' for sets.
- statistic_name - The name of the variable to be sent to StatsD. Statistic names cannot contain the pipe (|) character.
- value - The value of the variable to be sent to StatsD. Values must be numeric. Values for gauge and counter metrics can be sent with a '+' or '-' to update a value after the value has been initialized. Only counters can be initialized as negative. Sets can send a string as the value parameter, but the string cannot contain the pipe character.
- sample_rate - The value of the sample rate to be sent to StatsD. Sample rates less than or equal to 0 will never be sent and sample rates greater than or equal to 1 will always be sent. Any rate between 1 and 0 will be compared to a randomly generated value, and if it is greater than the random value, it will be sent.

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_StopMixMonitor

StopMixMonitor()

Synopsis

Stop recording a call through MixMonitor, and free the recording’s file handle.

Description

Stops the audio recording that was started with a call to MixMonitor() on the current channel.

Syntax

```
StopMixMonitor([MixMonitorID])
```

Arguments

- **MixMonitorID** - If a valid ID is provided, then this command will stop only that specific MixMonitor.

See Also

- Asterisk 14 Application_MixMonitor

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_StopMonitor

StopMonitor()

Synopsis
Stop monitoring a channel.

Description
Stops monitoring a channel. Has no effect if the channel is not monitored.

Syntax

```
StopMonitor();
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_StopMusicOnHold

StopMusicOnHold()

Synopsis
Stop playing Music On Hold.

Description
Stops playing music on hold.

Syntax

StopMusicOnHold()

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_StopPlayTones

StopPlayTones()

Synopsis
Stop playing a tone list.

Description
Stop playing a tone list, initiated by PlayTones().

Syntax

StopPlayTones()

Arguments

See Also

- Asterisk 14 Application_PlayTones

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_System

System()

Synopsis
Execute a system command.

Description
Executes a command by using system(). If the command fails, the console should report a fallthrough.

Result of execution is returned in the SYSTEMSTATUS channel variable:

- SYSTEMSTATUS
  - FAILURE - Could not execute the specified command.
  - SUCCESS - Specified command successfully executed.

Syntax

System(command)

Arguments

- command - Command to execute

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_TestClient

TestClient()

Synopsis

Execute Interface Test Client.

Description

Executes test client with given testid. Results stored in /var/log/asterisk/testreports/<testid>-client.txt

Syntax

TestClient(testid)

Arguments

- testid - An ID to identify this test.

See Also

- Asterisk 14 Application_TestServer

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_TestServer

TestServer()

Synopsis
Execute Interface Test Server.

Description
Perform test server function and write call report. Results stored in /var/log/asterisk/testreports/<testid>-server.txt

Syntax

```plaintext
TestServer()
```

Arguments

See Also

- Asterisk 14 Application_TestClient

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Transfer

Transfer()

Synopsis
Transfer caller to remote extension.

Description
Requests the remote caller be transferred to a given destination. If TECH (SIP, IAX2, LOCAL etc) is used, only an incoming call with the same channel technology will be transferred. Note that for SIP, if you transfer before call is setup, a 302 redirect SIP message will be returned to the caller.

The result of the application will be reported in the TRANSFERSTATUS channel variable:

- **TRANSFERSTATUS**
  - SUCCESS - Transfer succeeded.
  - FAILURE - Transfer failed.
  - UNSUPPORTED - Transfer unsupported by channel driver.

Syntax

```plaintext
Transfer([Tech/destination])
```

Arguments

- dest
  - Tech/
  - destination

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_TryExec

TryExec()

Synopsis

Executes dialplan application, always returning.

Description

Allows an arbitrary application to be invoked even when not hard coded into the dialplan. To invoke external applications see the application System. Always returns to the dialplan. The channel variable TRYSTATUS will be set to one of:

- SUCCESS - If the application returned zero.
- FAILED - If the application returned non-zero.
- NOAPP - If the application was not found or was not specified.

Syntax

TryExec(appname(arguments))

Arguments

- appname
- arguments

See Also

Import Version

Asterisk 14 Application_TrySystem

TrySystem()

Synopsis
Try executing a system command.

Description
Executes a command by using system().
Result of execution is returned in the SYSTEMSTATUS channel variable:

- SYSTEMSTATUS
  - FAILURE - Could not execute the specified command.
  - SUCCESS - Specified command successfully executed.
  - APPERROR - Specified command successfully executed, but returned error code.

Syntax

```
TrySystem(command)
```

Arguments

- command - Command to execute

Asterisk 14 Application_UnpauseMonitor

UnpauseMonitor()

Synopsis
Unpause monitoring of a channel.

Description
Unpauses monitoring of a channel on which monitoring had previously been paused with PauseMonitor.

Syntax

```
UnpauseMonitor()
```

Arguments

See Also

- Asterisk 14 Application_PauseMonitor

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_UnpauseQueueMember

UnpauseQueueMember()

Synopsis

Unpauses a queue member.

Description

Unpauses (resumes calls to) a queue member. This is the counterpart to PauseQueueMember() and operates exactly the same way, except it unpauses instead of pausing the given interface.

This application sets the following channel variable upon completion:

- **UPQMSTATUS** - The status of the attempt to unpause a queue member as a text string.
  - UNPAUSED
  - NOTFOUND

Example: UnpauseQueueMember(SIP/3000)

Syntax

```plaintext
UnpauseQueueMember([queuename,interface,[options,[reason]]])
```

Arguments

- `queuename`
- `interface`
- `options`
- `reason` - Is used to add extra information to the appropriate queue_log entries and manager events.

See Also

- Asterisk 14 Application_Queue

Asterisk 14 Application_UserEvent

UserEvent()

Synopsis
Send an arbitrary user-defined event to parties interested in a channel (AMI users and relevant res_stasis applications).

Description
Sends an arbitrary event to interested parties, with an optional body representing additional arguments. The body may be specified as a , delimited list of key:value pairs.

For AMI, each additional argument will be placed on a new line in the event and the format of the event will be:

Event: UserEvent
UserEvent: <specified event name>
[body]

If no body is specified, only Event and UserEvent headers will be present.

For res_stasis applications, the event will be provided as a JSON blob with additional arguments appearing as keys in the object and the eventname under the eventname key.

Syntax
UserEvent(eventName, [body])

Arguments
- eventName
- body

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Verbose

Verbose()

Synopsis
Send arbitrary text to verbose output.

Description
Sends an arbitrary text message to verbose output.

Syntax

```
Verbose([level,]message)
```

Arguments
- level - Must be an integer value. If not specified, defaults to 0.
- message - Output text message.

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_VMAuthenticate

VMAuthenticate()

Synopsis
Authenticate with Voicemail passwords.

Description
This application behaves the same way as the Authenticate application, but the passwords are taken from voicemail.conf. If the mailbox is specified, only that mailbox's password will be considered valid. If the mailbox is not specified, the channel variable AUTH_MAILBOX will be set with the authenticated mailbox.

The VMAuthenticate application will exit if the following DTMF digit is entered as Mailbox or Password, and the extension exists:

- * - Jump to the a extension in the current dialplan context.

Syntax

```
VMAuthenticate([mailbox@[context]],[options])
```

Arguments

- mailbox
- context
- options
  - s - Skip playing the initial prompts.

Asterisk 14 Application_VMSayName

VMSayName()

Synopsis
Play the name of a voicemail user

Description
This application will say the recorded name of the voicemail user specified as the argument to this application. If no context is provided, default is assumed.

Syntax

```
VMSayName([mailbox@[context]])
```

Arguments

- **mailbox**
  - **mailbox**
  - **context**

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_VoiceMail

VoiceMail()

Synopsis

Leave a Voicemail message.

Description

This application allows the calling party to leave a message for the specified list of mailboxes. When multiple mailboxes are specified, the greeting will be taken from the first mailbox specified. Dialplan execution will stop if the specified mailbox does not exist.

The Voicemail application will exit if any of the following DTMF digits are received:

- 0 - Jump to the o extension in the current dialplan context.
- * - Jump to the a extension in the current dialplan context.

This application will set the following channel variable upon completion:

- VMSTATUS - This indicates the status of the execution of the VoiceMail application.
  - SUCCESS
  - USEREXIT
  - FAILED

Syntax

```
VoiceMail(mailbox1&[mailbox2&...&],[options])
```

Arguments

- **mailboxes**
  - mailbox1
    - mailbox
    - context
  - mailbox2
    - mailbox
    - context
- **options**
  - b - Play the busy greeting to the calling party.
  - d - Accept digits for a new extension in context c, if played during the greeting. Context defaults to the current context.
  - c
  - g - Use the specified amount of gain when recording the voicemail message. The units are whole-number decibels (dB). Only works on supported technologies, which is DAHDI only.
  - #
  - s - Skip the playback of instructions for leaving a message to the calling party.
  - u - Play the unavailable greeting.
  - U - Mark message as URGENT.
  - P - Mark message as PRIORITY.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_VoiceMailMain

VoiceMailMain()

Synopsis

Check Voicemail messages.

Description

This application allows the calling party to check voicemail messages. A specific mailbox, and optional corresponding context, may be specified. If a mailbox is not provided, the calling party will be prompted to enter one. If a context is not specified, the default context will be used.

The VoiceMailMain application will exit if the following DTMF digit is entered as Mailbox or Password, and the extension exists:

- * - Jump to the a extension in the current dialplan context.

Syntax

```
VoiceMailMain([mailbox@context],[options])
```

Arguments

- mailbox
  - mailbox
  - context
- options
  - p - Consider the mailbox parameter as a prefix to the mailbox that is entered by the caller.
  - g - Use the specified amount of gain when recording a voicemail message. The units are whole-number decibels (dB).
  - # -
  - s - Skip checking the passcode for the mailbox.
  - a - Skip folder prompt and go directly to folder specified. Defaults to INBOX (or 0).
    - folder
      - 0 - INBOX
      - 1 - Old
      - 2 - Work
      - 3 - Family
      - 4 - Friends
      - 5 - Cust1
      - 6 - Cust2
      - 7 - Cust3
      - 8 - Cust4
      - 9 - Cust5

Asterisk 14 Application_VoiceMailPlayMsg

VoiceMailPlayMsg()

Synopsis

Play a single voice mail msg from a mailbox by msg id.

Description

This application sets the following channel variable upon completion:

- `VOICEMAIL_PLAYBACKSTATUS` - The status of the playback attempt as a text string.
  - `SUCCESS`
  - `FAILED`

Syntax

```
VoiceMailPlayMsg([mailbox@][context]),msg_id)
```

Arguments

- `mailbox`  
  - `mailbox`  
  - `context`  
  - `msg_id` - The msg id of the msg to play back.

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Wait

Wait()

Synopsis
Waits for some time.

Description
This application waits for a specified number of seconds.

Syntax

```plaintext
Wait(seconds)
```

Arguments
- `seconds` - Can be passed with fractions of a second. For example, 1.5 will ask the application to wait for 1.5 seconds.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_WaitExten

WaitExten()

Synopsis

Waits for an extension to be entered.

Description

This application waits for the user to enter a new extension for a specified number of seconds.

**Warning**

Use of the application **WaitExten** within a macro will not function as expected. Please use the **Read** application in order to read DTMF from a channel currently executing a macro.

Syntax

```plaintext
WaitExten([seconds,[options]])
```

Arguments

- **seconds** - Can be passed with fractions of a second. For example, 1.5 will ask the application to wait for 1.5 seconds.
- **options**
  - **m** - Provide music on hold to the caller while waiting for an extension.
  - **x** - Specify the class for music on hold. `CHANNEL(musicclass)` will be used instead if set

- Asterisk 14 Function_TIMEOUT

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_WaitForNoise

WaitForNoise()

Synopsis

Waits for a specified amount of noise.

Description

Waits for up to `noiserequired` milliseconds of noise, `iterations` times. An optional `timeout` specified the number of seconds to return after, even if we do not receive the specified amount of noise. Use `timeout` with caution, as it may defeat the purpose of this application, which is to wait indefinitely until noise is detected on the line.

Syntax

```bash
WaitForNoise(noiserequired, [iterations, [timeout]])
```

Arguments

- `noiserequired`
- `iterations` - If not specified, defaults to 1.
- `timeout` - Is specified only to avoid an infinite loop in cases where silence is never achieved.

See Also

- Asterisk 14 Application_WaitForSilence

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_WaitForRing

WaitForRing()

Synopsis
Wait for Ring Application.

Description
Returns 0 after waiting at least \textit{timeout} seconds, and only after the next ring has completed. Returns 0 on success or -1 on hangup.

Syntax

\begin{verbatim}
WaitForRing(timeout)
\end{verbatim}

Arguments

\begin{itemize}
  \item timeout
\end{itemize}

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_WaitForSilence

WaitForSilence()

Synopsis

Waits for a specified amount of silence.

Description

Waits for up to `silencerequired` milliseconds of silence, `iterations` times. An optional `timeout` specified the number of seconds to return after, even if we do not receive the specified amount of silence. Use `timeout` with caution, as it may defeat the purpose of this application, which is to wait indefinitely until silence is detected on the line. This is particularly useful for reverse-911-type call broadcast applications where you need to wait for an answering machine to complete its spiel before playing a message.

Typically you will want to include two or more calls to WaitForSilence when dealing with an answering machine; first waiting for the spiel to finish, then waiting for the beep, etc.

Examples:

- `WaitForSilence(500,2)` will wait for 1/2 second of silence, twice
- `WaitForSilence(1000)` will wait for 1 second of silence, once
- `WaitForSilence(300,3,10)` will wait for 300ms silence, 3 times, and returns after 10 sec, even if silence is not detected

Sets the channel variable `WAITSTATUS` to one of these values:

- `WAITSTATUS`
  - `SILENCE` - if exited with silence detected.
  - `TIMEOUT` - if exited without silence detected after timeout.

Syntax

```plaintext
WaitForSilence(silencerequired,[iterations,[timeout]])
```

Arguments

- `silencerequired`
- `iterations` - If not specified, defaults to 1.
- `timeout` - Is specified only to avoid an infinite loop in cases where silence is never achieved.

Asterisk 14 Application_WaitUntil

WaitUntil()

Synopsis
Wait (sleep) until the current time is the given epoch.

Description
Waits until the given epoch.
Set WAITUNTILSTATUS to one of the following values:

- OK - Wait succeeded.
- FAILURE - Invalid argument.
- HANGUP - Channel hungup before time elapsed.
- PAST - Time specified had already past.

Syntax

```plaintext
WaitUntil(epoch)
```

Arguments

- `epoch`

Asterisk 14 Application_While

**While()**

**Synopsis**
Start a while loop.

**Description**
Start a While Loop. Execution will return to this point when `EndWhile()` is called until `expr` is no longer true.

**Syntax**
```plaintext
While(expr)
```

**Arguments**
- `expr`

**See Also**
- Asterisk 14 Application_EndWhile
- Asterisk 14 Application_ExitWhile
- Asterisk 14 Application_ContinueWhile

**Import Version**
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Application_Zapateller

Zapateller()

Synopsis
Block telemarketers with SIT.

Description
Generates special information tone to block telemarketers from calling you.

This application will set the following channel variable upon completion:

- ZAPATELLERSTATUS - This will contain the last action accomplished by the Zapateller application. Possible values include:
  - NOTHING
  - ANSWERED
  - ZAPPED

Syntax

Zapateller(options)

Arguments

- options - Comma delimited list of options.
  - answer - Causes the line to be answered before playing the tone.
  - nocallerid - Causes Zapateller to only play the tone if there is no callerid information available.

Asterisk 14 Function_AES_DECRYPT

AES_DECRYPT()

Synopsis
Decrypt a string encoded in base64 with AES given a 16 character key.

Description
Returns the plain text string.

Syntax

```
AES_DECRYPT(key,string)
```

Arguments
- **key** - AES Key
- **string** - Input string.

**Asterisk 14 Function_AES_ENCRYPT**

**AES_ENCRYPT()**

**Synopsis**
Encrypt a string with AES given a 16 character key.

**Description**
Returns an AES encrypted string encoded in base64.

**Syntax**

```plaintext
AES_ENCRYPT(key,string)
```

**Arguments**
- **key** - AES Key
- **string** - Input string

**See Also**
- Asterisk 14 Function_AES_DECRYPT

Asterisk 14 Function_AGCA

AGC()

Synopsis

Apply automatic gain control to audio on a channel.

Description

The AGC function will apply automatic gain control to the audio on the channel that it is executed on. Using rx for audio received and tx for audio transmitted to the channel. When using this function you set a target audio level. It is primarily intended for use with analog lines, but could be useful for other channels as well. The target volume is set with a number between 1–32768. The larger the number the louder (more gain) the channel will receive.

Examples:

exten => 1,1,Set(AGC(rx)=8000)

exten => 1,2,Set(AGC(tx)=off)

Syntax

AGC(channeldirection)

Arguments

- channeldirection - This can be either rx or tx

Asterisk 14 Function_AGENT

AGENT()

Synopsis
Gets information about an Agent

Description

Syntax

```
AGENT(AgentId:item)
```

Arguments

- **AgentId**
- **item** - The valid items to retrieve are:
  - **status** - (default) The status of the agent (LOGGEDIN | LOGGEDOUT)
  - **password** - Deprecated. The dialplan handles any agent authentication.
  - **name** - The name of the agent
  - **mohclass** - MusicOnHold class
  - **channel** - The name of the active channel for the Agent (AgentLogin)
  - **fullchannel** - The untruncated name of the active channel for the Agent (AgentLogin)

Asterisk 14 Function_AMI_CLIENT

AMI_CLIENT()

Synopsis
Checks attributes of manager accounts

Description
Currently, the only supported parameter is "sessions" which will return the current number of active sessions for this AMI account.

Syntax

AMI_CLIENT(loginname, field)

Arguments

- loginname - Login name, specified in manager.conf
- field - The manager account attribute to return
  - sessions - The number of sessions for this AMI account

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ARRAY

ARRAY()

Synopsis

Allows setting multiple variables at once.

Description

The comma-delimited list passed as a value to which the function is set will be interpreted as a set of values to which the comma-delimited list of variable names in the argument should be set.

Example: Set(ARRAY(var1,var2)=1,2) will set var1 to 1 and var2 to 2

Syntax

ARRAY(var1[,var2[,...],[varN]])

Arguments

- var1
- var2
- varN

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_AST_CONFIG

AST_CONFIG()

Synopsis
Retrieve a variable from a configuration file.

Description
This function reads a variable from an Asterisk configuration file.

Syntax

```
AST_CONFIG(config_file, category, variable_name[, index])
```

Arguments
- `config_file`
- `category`
- `variable_name`
- `index` - If there are multiple variables with the same name, you can specify 0 for the first item (default), -1 for the last item, or any other number for that specific item. -1 is useful when the variable is derived from a template and you want the effective value (the last occurrence), not the value from the template (the first occurrence).

Asterisk 14 Function_AST_SORCERY

AST_SORCERY()

Synopsis

Get a field from a sorcery object

Description

Syntax

```
AST_SORCERY(module_name, object_type, object_id, field_name[, retrieval_method[, retrieval_details]])
```

Arguments

- `module_name` - The name of the module owning the sorcery instance.
- `object_type` - The type of object to query.
- `object_id` - The id of the object to query.
- `field_name` - The name of the field.
- `retrieval_method` - Fields that have multiple occurrences may be retrieved in two ways.
  - `concat` - Returns all matching fields concatenated in a single string separated by `separator` which defaults to ,.
  - `single` - Returns the nth occurrence of the field as specified by `occurrence_number` which defaults to 1.
    The default is `concat` with `separator` ,.
- `retrieval_details` - Specifies either the `separator` for `concat` or the `occurrence_number` for `single`.

Asterisk 14 Function_AUDIOHOOK_INHERIT

AUDIOHOOK_INHERIT()

Synopsis
DEPRECATED: Used to set whether an audiohook may be inherited to another channel. Due to architectural changes in Asterisk 12, audiohook inheritance is performed automatically and this function now lacks function.

Description
Prior to Asterisk 12, masquerades would occur under all sorts of situations which were hard to predict. In Asterisk 12, masquerades only occur as a result of a small set of operations for which inheriting all audiohooks from the original channel is now safe. So in Asterisk 12.5+, all audiohooks are inherited without needing other controls expressing which audiohooks should be inherited under which conditions.

Syntax

Asterisk 14 Function_BLACKLIST

BLACKLIST()

Synopsis

Check if the callerid is on the blacklist.

Description

Uses astdb to check if the Caller*ID is in family blacklist. Returns 1 or 0.

Syntax

```
BLACKLIST()
```

Arguments

See Also

- Asterisk 14 Function_DB

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function CALENDAR_BUSY

CALENDAR_BUSY()

Synopsis
Determine if the calendar is marked busy at this time.

Description
Check the specified calendar's current busy status.

Syntax

```
CALENDAR_BUSY(calendar)
```

Arguments
- `calendar`

See Also
- Asterisk 14 Function CALENDAR_EVENT
- Asterisk 14 Function CALENDAR_QUERY
- Asterisk 14 Function CALENDAR_QUERY_RESULT
- Asterisk 14 Function CALENDAR_WRITE

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_CALENDAR_EVENT

CALENDAR_EVENT()

Synopsis
Get calendar event notification data from a notification call.

Description
Whenever a calendar event notification call is made, the event data may be accessed with this function.

Syntax

```plaintext
CALENDAR_EVENT(field)
```

Arguments
- **field**
  - summary - The VEVENT SUMMARY property or Exchange event 'subject'
  - description - The text description of the event
  - organizer - The organizer of the event
  - location - The location of the event
  - categories - The categories of the event
  - priority - The priority of the event
  - calendar - The name of the calendar associated with the event
  - uid - The unique identifier for this event
  - start - The start time of the event
  - end - The end time of the event
  - busystate - The busy state of the event 0=FREE, 1=TENTATIVE, 2=BUSY

See Also

Asterisk 14 Function_CALENDAR_QUERY

CALENDAR_QUERY()

Synopsis

Query a calendar server and store the data on a channel

Description

Get a list of events in the currently accessible timeframe of the calendar The function returns the id for accessing the result with CALENDAR_QUERY_RESULT()

Syntax

```
CALENDAR_QUERY(calendar[,start[,end]])
```

Arguments

- `calendar` - The calendar that should be queried
- `start` - The start time of the query (in seconds since epoch)
- `end` - The end time of the query (in seconds since epoch)

See Also

- Asterisk 14 Function_CALENDAR_BUSY
- Asterisk 14 Function_CALENDAR_EVENT
- Asterisk 14 Function_CALENDAR_QUERY_RESULT

Asterisk 14 FunctionCALENDAR_QUERY_RESULT

CALENDAR_QUERY_RESULT()

Synopsis
Retrieve data from a previously run CALENDAR_QUERY() call

Description
After running CALENDAR_QUERY and getting a result id, calling CALENDAR_QUERY with that id and a field will return the data for that field. If multiple events matched the query, and entry is provided, information from that event will be returned.

Syntax

```
CALENDAR_QUERY_RESULT(id,field[,entry])
```

Arguments
- id - The query ID returned by CALENDAR_QUERY
- field
  - getnum - number of events occurring during time range
  - summary - A summary of the event
  - description - The full event description
  - organizer - The event organizer
  - location - The event location
  - categories - The categories of the event
  - priority - The priority of the event
  - calendar - The name of the calendar associated with the event
  - uid - The unique identifier for the event
  - start - The start time of the event (in seconds since epoch)
  - end - The end time of the event (in seconds since epoch)
  - busystate - The busy status of the event 0=FREE, 1=TENTATIVE, 2=BUSY
- entry - Return data from a specific event returned by the query

Asterisk 14 Function_CALENDAR_WRITE

CALENDAR_WRITE()

Synopsis
Write an event to a calendar

Description
Example: CALENDAR_WRITE(calendar,field1,field2,field3)=val1,val2,val3
The field and value arguments can easily be set/passed using the HASHKEYS() and HASH() functions
- CALENDAR_SUCCESS - The status of the write operation to the calendar
  • 1 - The event was successfully written to the calendar.
  • 0 - The event was not written to the calendar due to network issues, permissions, etc.

Syntax

```
CALENDAR_WRITE(calendar,field[,...])
```

Arguments
- calendar - The calendar to write to
- field
  • summary - A summary of the event
  • description - The full event description
  • organizer - The event organizer
  • location - The event location
  • categories - The categories of the event
  • priority - The priority of the event
  • uid - The unique identifier for the event
  • start - The start time of the event (in seconds since epoch)
  • end - The end time of the event (in seconds since epoch)
  • busystate - The busy status of the event 0=FREE, 1=TENTATIVE, 2=BUSY

See Also

Asterisk 14 Function_CALLCOMPLETION

CALLCOMPLETION()

Synopsis
Get or set a call completion configuration parameter for a channel.

Description
The CALLCOMPLETION function can be used to get or set a call completion configuration parameter for a channel. Note that setting a configuration parameter will only change the parameter for the duration of the call. For more information see doc/AST.pdf. For more information on call completion parameters, see configs/ccss.conf.sample.

Syntax
CALLCOMPLETION(option)

Arguments
- option - The allowable options are:
  - cc_agent_policy
  - cc_monitor_policy
  - cc_offer_timer
  - ccnr_available_timer
  - ccbs_available_timer
  - cc_recall_timer
  - cc_max_agents
  - cc_max_monitors
  - cc_callback_macro
  - cc_agent_dialstring

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_CALLERID

CALLERID()

Synopsis

Gets or sets Caller*ID data on the channel.

Description

Gets or sets Caller*ID data on the channel. Uses channel callerid by default or optional callerid, if specified.

The `pres` field gets/sets a combined value for `name-pres` and `num-pres`.

The allowable values for the `name-charset` field are the following:

- unknown - Unknown
- iso8859-1 - ISO8859-1
- withdrawn - Withdrawn
- iso8859-2 - ISO8859-2
- iso8859-3 - ISO8859-3
- iso8859-4 - ISO8859-4
- iso8859-5 - ISO8859-5
- iso8859-7 - ISO8859-7
- bmp - ISO10646 Bmp String
- utf8 - ISO10646 UTF-8 String

Syntax

```
CALLERID(datatype,CID)
```

Arguments

- **datatype** - The allowable datatypes are:
  - all
  - name
  - name-valid
  - name-charset
  - name-pres
  - num
  - num-valid
  - num-plan
  - num-pres
  - pres
  - subaddr
  - subaddr-valid
  - subaddr-type
  - subaddr-odd
  - tag
  - priv-all
  - priv-name
  - priv-name-valid
  - priv-name-charset
  - priv-name-pres
  - priv-num
  - priv-num-valid
  - priv-num-plan
  - priv-num-pres
  - priv-subaddr
  - priv-subaddr-valid
  - priv-subaddr-type
  - priv-subaddr-odd
  - priv-tag
  - ANI-all
  - ANI-name
  - ANI-name-valid
  - ANI-name-charset
  - ANI-name-pres
  - ANI-num
• ANI-num-valid
• ANI-num-plan
• ANI-num-pres
• ANI-tag
• RDNIS
• DNID
• dnid-num-plan
• dnid-subaddr
• dnid-subaddr-valid
• dnid-subaddr-type
• dnid-subaddr-odd

• CID - Optional Caller*ID to parse instead of using the Caller*ID from the channel. This parameter is only optional when reading the Caller*ID.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_CALLERPRES

CALLERPRES()

Synopsis

Gets or sets Caller*ID presentation on the channel.

Description

Gets or sets Caller*ID presentation on the channel. This function is deprecated in favor of CALLERID(num-pres) and CALLERID(name-pres) or CALLERID(pres) to get/set both at once. The following values are valid:

- allowed_not_screened - Presentation Allowed, Not Screened.
- allowed_passed_screen - Presentation Allowed, Passed Screen.
- allowed_failed_screen - Presentation Allowed, Failed Screen.
- allowed - Presentation Allowed, Network Number.
- prohib_not_screened - Presentation Prohibited, Not Screened.
- prohib_passed_screen - Presentation Prohibited, Passed Screen.
- prohib_failed_screen - Presentation Prohibited, Failed Screen.
- prohib - Presentation Prohibited, Network Number.
- unavailable - Number Unavailable.

Syntax

CALLERPRES()

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_CDR

CDR()

Synopsis

Gets or sets a CDR variable.

Description

All of the CDR field names are read-only, except for `accountcode`, `userfield`, and `amaflags`. You may, however, supply a name not on the above list, and create your own variable, whose value can be changed with this function, and this variable will be stored on the CDR.

```
Note
CDRs can only be modified before the bridge between two channels is torn down. For example, CDRs may not be modified after the Dial application has returned.
```

Example: `exten => 1,1,Set(CDR(userfield)=test)`

Syntax

```
CDR(name[,options])
```

Arguments

- `name` - CDR field name:
  - `clid` - Caller ID.
  - `lastdata` - Last application arguments.
  - `disposition` - The final state of the CDR.
    - 0 - NO ANSWER
    - 1 - NO ANSWER (NULL record)
    - 2 - FAILED
    - 4 - BUSY
    - 8 - ANSWERED
    - 16 - CONGESTION
  - `src` - Source.
  - `start` - Time the call started.
  - `amaflags` - R/W the Automatic Message Accounting (AMA) flags on the channel. When read from a channel, the integer value will always be returned. When written to a channel, both the string format or integer value is accepted.
    - 1 - OMIT
    - 2 - BILLING
    - 3 - DOCUMENTATION
  - `dst` - Destination.
  - `answer` - Time the call was answered.
  - `accountcode` - The channel's account code.
  - `dcontext` - Destination context.
  - `end` - Time the call ended.
  - `uniqueid` - The channel's unique id.
  - `dstchannel` - Destination channel.
  - `duration` - Duration of the call.
  - `userfield` - The channel's user specified field.
  - `lastapp` - Last application.
  - `billsec` - Duration of the call once it was answered.
  - `channel` - Channel name.
  - `sequence` - CDR sequence number.
- `options` - f - Returns billsec or duration fields as floating point values.

```
Warning
Accessing this setting is deprecated in CDR. Please use the CHANNEL function instead.
```

Warning
Accessing this setting is deprecated in CDR. Please use the CHANNEL function instead.
- \texttt{u} - Retrieves the raw, unprocessed value. For example, 'start', 'answer', and 'end' will be retrieved as epoch values, when the \texttt{u} option is passed, but formatted as YYYY-MM-DD HH:MM:SS otherwise. Similarly, disposition and amatflags will return their raw integral values.

Asterisk 14 Function_CDR_PROP

CDR_PROP()

Synopsis
Set a property on a channel's CDR.

Description
This function sets a property on a channel's CDR. Properties alter the behavior of how the CDR operates for that channel.

Syntax

<table>
<thead>
<tr>
<th>CDR_PROP(name)</th>
</tr>
</thead>
</table>

Arguments

- **name** - The property to set on the CDR.
- **party_a** - Set this channel as the preferred Party A when channels are associated together. Write-Only
- **disable** - Setting to 1 will disable CDRs for this channel. Setting to 0 will enable CDRs for this channel. Write-Only

Asterisk 14 Function CHANNEL

CHANNEL()

Synopsis

Gets/sets various pieces of information about the channel.

Description

Gets/sets various pieces of information about the channel. Additional item may be available from the channel driver; see its documentation for details. Any item requested that is not available on the current channel will return an empty string.

Syntax

```
CHANNEL(item)
```

Arguments

- **item**: Standard items (provided by all channel technologies) are:

  - **amaflags**: R/W the Automatic Message Accounting (AMA) flags on the channel. When read from a channel, the integer value will always be returned. When written to a channel, both the string format or integer value is accepted.
    - 1 - OMIT
    - 2 - BILLING
    - 3 - DOCUMENTATION
  - **accountcode**: R/W the channel's account code.
  - **audioreadformat**: R/O format currently being read.
  - **audionativeformat**: R/O format used natively for audio.
  - **audiowriteformat**: R/O format currently being written.
  - **dtmf_features**: R/W the channel's DTMF bridge features. May include one or more of 'T' 'K' 'H' 'W' and 'X' in a similar manner to options in the Dial application. When setting it, the features string must be all upper case.
  - **callgroup**: R/W numeric call pickup groups that this channel is a member.
  - **pickupgroup**: R/W numeric call pickup groups this channel can pickup.
  - **namedcallgroup**: R/W named call pickup groups that this channel is a member.
  - **namedpickupgroup**: R/W named call pickup groups this channel can pickup.
  - **channeltype**: R/O technology used for channel.
  - **checkhangup**: R/O Whether the channel is hanging up (1/0)
  - **after_bridge_goto**: R/W the parseable goto string indicating where the channel is expected to return to in the PBX after exiting the next bridge it joins on the condition that it doesn't hang up. The parseable goto string uses the same syntax as the Go application.
  - **hangup_handler_pop**: W/O Replace the most recently added hangup handler with a new hangup handler on the channel if supplied. The assigned string is passed to the Gosub application when the channel is hung up. Any optionally omitted context and exten are supplied by the channel pushing the handler before it is pushed.
  - **hangup_handler_push**: W/O Push a hangup handler onto the channel hangup handler stack. The assigned string is passed to the Gosub application when the channel is hung up. Any optionally omitted context and exten are supplied by the channel pushing the handler before it is pushed.
  - **hangup_handler_wipe**: W/O Wipe the entire hangup handler stack and replace with a new hangup handler on the channel if supplied. The assigned string is passed to the Gosub application when the channel is hung up. Any optionally omitted context and exten are supplied by the channel pushing the handler before it is pushed.
  - **onhold**: R/O Whether or not the channel is onhold. (1/0)
  - **language**: R/W language for sounds played.
  - **musicclass**: R/W class (from musiconhold.conf) for hold music.
  - **name**: The name of the channel
  - **parkinglot**: R/W parking lot for parking.
  - **txgain**: R/W set txgain level on channel drivers that support it.
  - **secure_bridge_signaling**: Whether or not channels bridged to this channel require secure signaling (1/0)
  - **secure_bridge_media**: Whether or not channels bridged to this channel require secure media (1/0)
  - **state**: R/O state of the channel
  - **tonezone**: R/W zone for indications played
  - **transfercapability**: R/W ISDN Transfer Capability, one of:
    - SPEECH
    - DIGITAL
    - RESTRICTED_DIGITAL
    - 3K1AUDIO
    - DIGITAL_W_TONES
    - VIDEO
  - **txgain**: R/W set txgain level on channel drivers that support it.
• videonativeformat - R/O format used natively for video
• trace - R/W whether or not context tracing is enabled, only available if CHANNEL_TRACE is defined.
• hangupsource - R/W returns the channel responsible for hangup.
• appname - R/O returns the internal application name.
• appdata - R/O returns the application data if available.
• exten - R/O returns the extension for an outbound channel.
• context - R/O returns the context for an outbound channel.
• channame - R/O returns the channel name for an outbound channel.
• uniqueid - R/O returns the channel uniqueid.
• linkedid - R/O returns the linkedid if available, otherwise returns the uniqueid.

chan_sip provides the following additional options:
• peerip - R/O Get the IP address of the peer.
• recvip - R/O Get the source IP address of the peer.
• recvport - R/O Get the source port of the peer.
• from - R/O Get the URI from the From: header.
• uri - R/O Get the URI from the Contact: header.
• useragent - R/O Get the useragent.
• peername - R/O Get the name of the peer.
• t38passthrough - R/O 1 if T38 is offered or enabled in this channel, otherwise 0.
• rtpqos - R/O Get QOS information about the RTP stream.

This option takes two additional arguments:
Argument 1: audio Get data about the audio stream
video Get data about the video stream
text Get data about the text stream

Argument 2:
local_ssrc Local SSRC (stream ID)
local_lostpackets Local lost packets
local_jitter Local calculated jitter
local_maxjitter Local calculated jitter (maximum)
local_minjitter Local calculated jitter (minimum)
{local_normdevjitter} Local calculated jitter (normal deviation)
local_stdevjitter Local calculated jitter (standard deviation)
local_count Number of received packets
remote_ssrc Remote SSRC (stream ID)
{remote_lostpackets} Remote lost packets
remote_jitter Remote reported jitter
remote_maxjitter Remote calculated jitter (maximum)
remote_minjitter Remote calculated jitter (minimum)
{remote_normdevjitter} Remote calculated jitter (normal deviation)
{remote_stdevjitter} Remote calculated jitter (standard deviation)
remote_count Number of transmitted packets
rtt Round trip time
maxrtt Round trip time (maximum)
minttt Round trip time (minimum)
normdevrttt Round trip time (normal deviation)
stdevrttt Round trip time (standard deviation)
all All statistics (in a form suited to logging, but not for parsing)

• rtpdest - R/O Get remote RTP destination information.

This option takes one additional argument:
Argument 1: audio Get audio destination
video Get video destination
text Get text destination

Defaults to audio if unspecified.

• rtpsource - R/O Get source RTP destination information.

This option takes one additional argument:
Argument 1: audio Get audio destination
video Get video destination
text Get text destination

Defaults to audio if unspecified.

• Technology: PJSIP
  • rtp - R/O Retrieve media related information.
    • type - When rtp is specified, the type parameter must be provided. It specifies which RTP parameter to read.
    • src - Retrieve the local address for RTP.
    • dest - Retrieve the remote address for RTP.
    • direct - If direct media is enabled, this address is the remote address used for RTP.
- **secure** - Whether or not the media stream is encrypted.
  - 0 - The media stream is not encrypted.
  - 1 - The media stream is encrypted.
- **hold** - Whether or not the media stream is currently restricted due to a call hold.
  - 0 - The media stream is not held.
  - 1 - The media stream is held.
- **media_type** - When *rtp* is specified, the *media_type* parameter may be provided. It specifies which media stream the chosen RTP parameter should be retrieved from.
  - audio - Retrieve information from the audio media stream.
  - video - Retrieve information from the video media stream.
  - rtcp - R/O Retrieve RTCP statistics.
    - **statistic** - When *rtcp* is specified, the *statistic* parameter must be provided. It specifies which RTCP statistic parameter to read.
      - all - Retrieve a summary of all RTCP statistics.
        The following data items are returned in a semi-colon delineated list:
        - ssrc - Our Synchronization Source identifier
        - themssrc - Their Synchronization Source identifier
        - tp - Our lost packet count
        - rxjitter - Received packet jitter
        - rxcnt - Received packet count
        - txjitter - Transmitted packet jitter
        - txcnt - Transmitted packet count
        - rlp - Remote lost packet count
        - rtt - Round trip time
      - all_jitter - Retrieve a summary of all RTCP Jitter statistics.
        The following data items are returned in a semi-colon delineated list:
        - minrxjitter - Our minimum jitter
        - maxrxjitter - Our max jitter
        - avgrxjitter - Our average jitter
        - stddevrxjitter - Our jitter standard deviation
        - reported_minjitter - Their minimum jitter
        - reported_maxjitter - Their max jitter
        - reported_avgjitter - Their average jitter
        - reported_stdevjitter - Their jitter standard deviation
      - all_loss - Retrieve a summary of all RTCP packet loss statistics.
        The following data items are returned in a semi-colon delineated list:
        - minrxlost - Our minimum lost packets
        - maxrxlost - Our max lost packets
        - avgrxlost - Our average lost packets
        - stddevrxlost - Our lost packets standard deviation
        - reported_minlost - Their minimum lost packets
        - reported_maxlost - Their max lost packets
        - reported_avglost - Their average lost packets
        - reported_stdevlost - Their lost packets standard deviation
      - all_rtt - Retrieve a summary of all RTCP round trip time information.
        The following data items are returned in a semi-colon delineated list:
        - minrtt - Minimum round trip time
        - maxrtt - Maximum round trip time
        - avgrtt - Average round trip time
        - stddevrtt - Standard deviation round trip time
    - txcount - Transmitted packet count
    - rxcnt - Received packet count
    - txjitter - Transmitted packet jitter
    - rxjitter - Received packet jitter
    - remote_maxjitter - Their max jitter
    - remote_minjitter - Their minimum jitter
    - remote_normdevjitter - Their average jitter
    - remote_stddevjitter - Their jitter standard deviation
    - local_maxjitter - Our max jitter
    - local_minjitter - Our minimum jitter
    - local_normdevjitter - Our average jitter
    - local_stddevjitter - Our jitter standard deviation
    - txploss - Transmitted packet loss
    - rxploss - Received packet loss

Note
If not specified, *audio* is used by default.
• remote_maxrxploss - Their max lost packets
• remote_minrxploss - Their minimum lost packets
• remote_normdevrxploss - Their lost packets standard deviation
• remote_stdevrxploss - Their lost packets standard deviation
• local_maxrxploss - Our max lost packets
• local_minrxploss - Our minimum lost packets
• local_normdevrxploss - Our lost packets standard deviation
• local_stdevrxploss - Our lost packets standard deviation
• rtt - Round trip time
• maxrtt - Maximum round trip time
• minrtt - Minimum round trip time
• normdevrtt - Average round trip time
• stdevrtt - Standard deviation round trip time
• local_ssrc - Our Synchronization Source identifier
• remote_ssrc - Their Synchronization Source identifier
• media_type - When rtpc is specified, the media_type parameter may be provided. It specifies which media stream the chosen RTCP parameter should be retrieved from.
• audio - Retrieve information from the audio media stream.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>If not specified, audio is used by default.</td>
</tr>
</tbody>
</table>

• video - Retrieve information from the video media stream.
• endpoint - R/O The name of the endpoint associated with this channel. Use the PJSIP_ENDPOIN function to obtain further endpoint related information.
• contact - R/O The name of the contact associated with this channel. Use the PJSIP_CONTACT function to obtain further contact related information. Note this may not be present and if so is only available on outgoing legs.
• aor - R/O The name of the AOR associated with this channel. Use the PJSIP_AOR function to obtain further AOR related information. Note this may not be present and if so is only available on outgoing legs.
• pjsip - R/O Obtain information about the current PJSIP channel and its session.
• type - When pjsip is specified, the type parameter must be provided. It specifies which signalling parameter to read.
• call-id - The SIP call-id.
• secure - Whether or not the signalling uses a secure transport.
  • 0 - The signalling uses a non-secure transport.
  • 1 - The signalling uses a secure transport.
• target_uri - The request URI of the INVITE request associated with the creation of this channel.
• local_uri - The local URI.
• remote_uri - The remote URI.
• t38state - The current state of any T.38 fax on this channel.
  • DISABLED - T.38 faxing is disabled on this channel.
  • LOCAL_REINVITE - Asterisk has sent a re-INVITE to the remote end to initiate a T.38 fax.
  • REMOTE_REINVITE - The remote end has sent a re-INVITE to Asterisk to initiate a T.38 fax.
  • ENABLED - A T.38 fax session has been enabled.
  • REJECTED - A T.38 fax session was attempted but was rejected.
• local_addr - On inbound calls, the full IP address and port number that the INVITE request was received on. On outbound calls, the full IP address and port number that the INVITE request was transmitted from.
• remote_addr - On inbound calls, the full IP address and port number that the INVITE request was received from. On outbound calls, the full IP address and port number that the INVITE request was transmitted to.

chan_iax2 provides the following additional options:
• osptoken - R/O Get the peer's osptoken.
• peerip - R/O Get the peer's ip address.
• peername - R/O Get the peer's username.
• secure_signaling - R/O Get the if the IAX channel is secured.
• secure_media - R/O Get the if the IAX channel is secured.

chan_dahdi provides the following additional options:
• dahdi_channel - R/O DAHDI channel related to this channel.
• dahdi_span - R/O DAHDI span related to this channel.
• dahdi_type - R/O DAHDI channel type, one of:
  • analog
  • mfc/r2
  • pri
  • pseudo
  • ss7
• keypad_digits - R/O PRI Keypad digits that came in with the SETUP message.
• reversecharge - R/O PRI Reverse Charging Indication, one of:
- l - None
- (1) - Reverse Charging Requested
- no_media_path - R/O PRI Nonzero if the channel has no B channel. The channel is either on hold or a call waiting call.
- buffers - W/O Change the channel's buffer policy (for the current call only)
  This option takes two arguments:
  Number of buffers,
  Buffer policy being one of:
  \texttt{full} \\
  \texttt{immediate} \\
  \texttt{half}
- echocan_mode - W/O Change the configuration of the active echo canceller on the channel (if any), for the current call only.
  Possible values are:
  \texttt{on} - Normal mode (the echo canceller is actually reinitialized) \\
  \texttt{off} - Disabled \\
  \texttt{fax} - FAX/data mode (NLP disabled if possible, otherwise completely disabled) \\
  \texttt{voice} - Voice mode (returns from FAX mode, reverting the changes that were made)
- chan_ooh323 provides the following additional options:
- faxdetect - R/W Fax Detect
  Returns 0 or 1
  Write yes or no
- t38support - R/W t38support
  Returns 0 or 1
  Write yes or no
- h323id_url - R/0 Returns caller URL
- caller_h323id - R/0 Returns caller h323id
- caller_dialeddigits - R/0 Returns caller dialed digits
- caller_email - R/0 Returns caller email
- callee_email - R/0 Returns callee email
- callee_dialeddigits - R/0 Returns callee dialed digits
- caller_url - R/0 Returns caller URL
- max_forwards - R/W Get or set the maximum number of call forwards for this channel. This number describes the number of times a call may be forwarded by this channel before the call fails. "Forwards" in this case refers to redirects by phones as well as calls to local channels. Note that this has no relation to the SIP Max-Forwards header.

Asterisk 14 Function CHANNELS

CHANNELS()

Synopsis

Gets the list of channels, optionally filtering by a regular expression.

Description

Gets the list of channels, optionally filtering by a regular expression. If no argument is provided, all known channels are returned. The regular_expression must correspond to the POSIX.2 specification, as shown in regex(7). The list returned will be space-delimited.

Syntax

```
CHANNELS(regular_expression)
```

Arguments

- `regular_expression`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_CHECKSIPDOMAIN

CHECKSIPDOMAIN()

Synopsis

Checks if domain is a local domain.

Description

This function checks if the domain in the argument is configured as a local SIP domain that this Asterisk server is configured to handle. Returns the domain name if it is locally handled, otherwise an empty string. Check the domain= configuration in sip.conf.

Syntax

```
CHECKSIPDOMAIN(domain)
```

Arguments

- domain

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_CONFBRIDGE

CONFBRIDGE()

Synopsis

Set a custom dynamic bridge, user, or menu profile on a channel for the ConfBridge application using the same options available in confbridge.conf.

Description

A custom profile uses the default profile type settings defined in confbridge.conf as defaults if the profile template is not explicitly specified first.

For bridge profiles the default template is default_bridge.

For menu profiles the default template is default_menu.

For users profiles the default template is default_user.

---- Example 1 ----

In this example the custom user profile set on the channel will automatically be used by the ConfBridge application.

```
exten => 1,1,Answer()

; In this example the effect of the following line is implied:

; same => n,Set(CONFBRIDGE(user,template)=default_user)

same => n,Set(CONFBRIDGE(user,announce_join_leave)=yes)

same => n,Set(CONFBRIDGE(user,startmuted)=yes)

same => n,ConfBridge(1)
```

---- Example 2 ----

This example shows how to use a predefined user profile in confbridge.conf as a template for a dynamic profile. Here we make an admin/marked user out of the my_user profile that you define in confbridge.conf.

```
exten => 1,1,Answer()

same => n,Set(CONFBRIDGE(user,template)=my_user)

same => n,Set(CONFBRIDGE(user,admin)=yes)

same => n,Set(CONFBRIDGE(user,marked)=yes)

same => n,ConfBridge(1)
```

Syntax

```
CONFBRIDGE(type,option)
```

Arguments

- **type** - To what type of conference profile the option applies.
  - bridge
  - menu
  - user

- **option** - Option refers to a confbridge.conf option that is being set dynamically on this channel, or clear to remove already applied profile options from the channel.

Asterisk 14 Function_CONFBRIDGE_INFO

CONFBRIDGE_INFO()

Synopsis

Get information about a ConfBridge conference.

Description

This function returns a non-negative integer for valid conference names and an empty string for invalid conference names.

Syntax

```
CONFBRIDGE_INFO(type,conf)
```

Arguments

- **type** - What conference information is requested.
  - **admins** - Get the number of admin users in the conference.
  - **locked** - Determine if the conference is locked. (0 or 1)
  - **marked** - Get the number of marked users in the conference.
  - **muted** - Determine if the conference is muted. (0 or 1)
  - **parties** - Get the number of users in the conference.
- **conf** - The name of the conference being referenced.

Asterisk 14 Function_CONNECTEDLINE

CONNECTEDLINE()

Synopsis

Gets or sets Connected Line data on the channel.

Description

Gets or sets Connected Line data on the channel.

The pres field gets/sets a combined value for name-pres and num-pres.

The allowable values for the name-charset field are the following:

- unknown - Unknown
- iso8859-1 - ISO8859-1
- withdrawn - Withdrawn
- iso8859-2 - ISO8859-2
- iso8859-3 - ISO8859-3
- iso8859-4 - ISO8859-4
- iso8859-5 - ISO8859-5
- iso8859-7 - ISO8859-7
- bmp - ISO10646 Bmp String
- utf8 - ISO10646 UTF-8 String

Syntax

CONNECTEDLINE(datatype,i)

Arguments

- datatype - The allowable datatypes are:
  - all
  - name
  - name-valid
  - name-charset
  - name-pres
  - num
  - num-valid
  - num-plan
  - num-pres
  - pres
  - subaddr
  - subaddr-valid
  - subaddr-type
  - subaddr-odd
  - tag
  - priv-all
  - priv-name
  - priv-name-valid
  - priv-name-charset
  - priv-name-pres
  - priv-num
  - priv-num-valid
  - priv-num-plan
  - priv-num-pres
  - priv-subaddr
  - priv-subaddr-valid
  - priv-subaddr-type
  - priv-subaddr-odd
  - priv-tag
  - i - If set, this will prevent the channel from sending out protocol messages because of the value being set

Asterisk 14 Function_CSV_QUOTE

CSV QUOTE()

Synopsis
Quotes a given string for use in a CSV file, escaping embedded quotes as necessary

Description
Example: ${CSV_QUOTE("a,b" 123)} will return """"a,b"""" 123"

Syntax
CSV QUOTE(string)

Arguments
- string

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function CURL

CURL()

Synopsis
Retrieve content from a remote web or ftp server

Description
When this function is read, a HTTP GET (by default) will be used to retrieve the contents of the provided url. The contents are returned as the result of the function.

Example: Displaying contents of a page

```plaintext
exten => s,1,Verbose(0, ${CURL(http://localhost:8088/static/astman.css)})
```

When this function is written to, a HTTP GET will be used to retrieve the contents of the provided url. The value written to the function specifies the destination file of the cURL'd resource.

Example: Retrieving a file

```plaintext
exten => s,1,Set(CURL(http://localhost:8088/static/astman.css)=/var/spool/asterisk/tmp/astman.css)
```

Note
If `live_dangerously` in `asterisk.conf` is set to `no`, this function can only be written to from the dialplan, and not directly from external protocols. Read operations are unaffected.

Syntax

```
CURL(url,post-data)
```

Arguments

- `url` - The full URL for the resource to retrieve.
- `post-data` - Read Only
  - If specified, an HTTP POST will be performed with the content of `post-data`, instead of an HTTP GET (default).

- Asterisk 14 Function_CURLOPT

Import Version

This documentation was imported from Asterisk Version GIT-14-46b4e67
Asterisk 14 Function_CURLOPT

CURLOPT()

Synopsis
Sets various options for future invocations of CURL.

Description
Options may be set globally or per channel. Per-channel settings will override global settings.

Syntax
CURLOPT(key)

Arguments
- **key**
  - **cookie** - A cookie to send with the request. Multiple cookies are supported.
  - **connecttimeout** - Number of seconds to wait for a connection to succeed
  - **dnstimeout** - Number of seconds to wait for DNS to be resolved
  - **ftptext** - For FTP URIs, force a text transfer (boolean)
  - **ftptimeout** - For FTP URIs, number of seconds to wait for a server response
  - **header** - Include header information in the result (boolean)
  - **httptimeout** - For HTTP(S) URIs, number of seconds to wait for a server response
  - **maxredirs** - Maximum number of redirects to follow
  - **proxy** - Hostname or IP address to use as a proxy server
  - **proxytype** - Type of proxy
    - http
    - socks4
    - socks5
  - **proxyport** - Port number of the proxy
  - **proxyuserpwd** - A `username:password` combination to use for authenticating requests through a proxy
  - **referer** - Referer URL to use for the request
  - **useragent** - UserAgent string to use for the request
  - **userpwd** - A `username:password` to use for authentication when the server response to an initial request indicates a 401 status code.
  - **ssl_verifypeer** - Whether to verify the server certificate against a list of known root certificate authorities (boolean).
  - **hashcompat** - Assuming the responses will be in `key1=value1&key2=value2` format, reformat the response such that it can be used by the `HASH` function.
    - yes
    - no
  - **legacy** - Also translate + to the space character, in violation of current RFC standards.

Asterisk 14 Function_CUT

CUT()

Synopsis
Slices and dices strings, based upon a named delimiter.

Description
Cut out information from a string (varname), based upon a named delimiter.

Syntax

```
CUT(varname,char-delim,range-spec)
```

Arguments

- **varname** - Variable you want cut
- **char-delim** - Delimiter, defaults to `-`
- **range-spec** - Number of the field you want (1-based offset), may also be specified as a range (with `-`) or group of ranges and fields (with `{}`)

Asterisk 14 Function_DB

DB()

Synopsis
Read from or write to the Asterisk database.

Description
This function will read from or write a value to the Asterisk database. On a read, this function returns the corresponding value from the database, or blank if it does not exist. Reading a database value will also set the variable DB_RESULT. If you wish to find out if an entry exists, use the DB_EXISTS function.

Syntax

```
DB(family/key)
```

Arguments

- family
- key

See Also

- Asterisk 14 Application_DBdel
- Asterisk 14 Function_DB_DELETE
- Asterisk 14 Application_DBdeltree
- Asterisk 14 Function_DB_EXISTS

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DB_DELETE

DB_DELETE()

Synopsis

Return a value from the database and delete it.

Description

This function will retrieve a value from the Asterisk database and then remove that key from the database. DB_RESULT will be set to the key’s value if it exists.

Note

If live_dangerously in asterisk.conf is set to no, this function can only be read from the dialplan, and not directly from external protocols. It can, however, be executed as a write operation (DB_DELETE(family, key)=ignored)

Syntax

```
DB_DELETE(family/key)
```

Arguments

- family
- key

See Also

- Asterisk 14 Application_DBdel
- Asterisk 14 Function_DB
- Asterisk 14 Application_DBdeltree

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DB_EXISTS

DB_EXISTS()

Synopsis

Check to see if a key exists in the Asterisk database.

Description

This function will check to see if a key exists in the Asterisk database. If it exists, the function will return 1. If not, it will return 0. Checking for existence of a database key will also set the variable DB_RESULT to the key's value if it exists.

Syntax

```
DB_EXISTS(family/key)
```

Arguments

- family
- key

See Also

- Asterisk 14 Function_DB

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DB_KEYS

DB_KEYS()

Synopsis

Obtain a list of keys within the Asterisk database.

Description

This function will return a comma-separated list of keys existing at the prefix specified within the Asterisk database. If no argument is provided, then a list of key families will be returned.

Syntax

```
DB_KEYS(prefix)
```

Arguments

- `prefix`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function DEC

DEC()

Synopsis
Decrements the value of a variable, while returning the updated value to the dialplan

Description
Decrements the value of a variable, while returning the updated value to the dialplan

Example: DEC(MyVAR) - Decrements MyVar

Note: DEC(${MyVAR}) - Is wrong, as DEC expects the variable name, not its value

Syntax

```
DEC(variable)
```

Arguments

- `variable` - The variable name to be manipulated, without the braces.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DENOISE

DENOISE()

Synopsis

Apply noise reduction to audio on a channel.

Description

The DENOISE function will apply noise reduction to audio on the channel that it is executed on. It is very useful for noisy analog lines, especially when adjusting gains or using AGC. Use rx for audio received from the channel and tx to apply the filter to the audio being sent to the channel.

Examples:
exten => 1,1,Set(DENOISE(rx)=on)
exten => 1,2,Set(DENOISE(tx)=off)

Syntax

DENOISE(channeldirection)

Arguments

- channeldirection - This can be either rx or tx the values that can be set to this are either on and off

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 FunctionDEVICE_STATE

DEVICE_STATE()

Synopsis
Get or Set a device state.

Description
The DEVICE_STATE function can be used to retrieve the device state from any device state provider. For example:
NoOp(SIP/mypeer has state ${DEVICE_STATE(SIP/mypeer)})
NoOp(Conference number 1234 has state ${DEVICE_STATE(MeetMe:1234)})

The DEVICE_STATE function can also be used to set custom device state from the dialplan. The Custom prefix must be used. For example:
Set(DEVICE_STATE(Custom:lamp1)=BUSY)
Set(DEVICE_STATE(Custom:lamp2)=NOT_INUSE)

You can subscribe to the status of a custom device state using a hint in the dialplan:
exten => 1234,hint,Custom:lamp1

The possible values for both uses of this function are:
UNKNOWN | NOT_INUSE | INUSE | BUSY | INVALID | UNAVAILABLE | RINGING | RINGINUSE | ONHOLD

Syntax

DEVICE_STATE(device)

Arguments

• device

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DIALGROUP

DIALGROUP()

Synopsis

Manages a group of users for dialing.

Description

Presents an interface meant to be used in concert with the Dial application, by presenting a list of channels which should be dialled when referenced.

When DIALGROUP is read from, the argument is interpreted as the particular group for which a dial should be attempted. When DIALGROUP is written to with no arguments, the entire list is replaced with the argument specified.

Functionality is similar to a queue, except that when no interfaces are available, execution may continue in the dialplan. This is useful when you want certain people to be the first to answer any calls, with immediate fallback to a queue when the front line people are busy or unavailable, but you still want front line people to log in and out of that group, just like a queue.

Example:

```plaintext
exten => 1,1,Set(DIALGROUP(mygroup,add)=SIP/10)
exten => 1,n,Set(DIALGROUP(mygroup,add)=SIP/20)
exten => 1,n,Dial(${DIALGROUP(mygroup)})
```

Syntax

```
DIALGROUP(group,op)
```

Arguments

- **group**
- **op** - The operation name, possible values are:
  - add - add a channel name or interface (write-only)
  - del - remove a channel name or interface (write-only)

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DIALPLAN_EXISTS

DIALPLAN_EXISTS()

Synopsis
Checks the existence of a dialplan target.

Description
This function returns 1 if the target exits. Otherwise, it returns 0.

Syntax
DIALPLAN_EXISTS(context,extension,priority)

Arguments
- context
- extension
- priority

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DUNDILOOKUP

DUNDILOOKUP()

Synopsis

Do a DUNDi lookup of a phone number.

Description

This will do a DUNDi lookup of the given phone number.

This function will return the Technology/Resource found in the first result in the DUNDi lookup. If no results were found, the result will be blank.

Syntax

DUNDILOOKUP(number,context,options)

Arguments

- number
- context - If not specified the default will be e164.
- options
  - b - Bypass the internal DUNDi cache

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DUNDIQUERY

DUNDIQUERY()

Synopsis

Initiate a DUNDi query.

Description

This will do a DUNDi lookup of the given phone number.
The result of this function will be a numeric ID that can be used to retrieve the results with the DUNDIRESULT function.

Syntax

```
DUNDIQUERY(number,context,options)
```

Arguments

- `number`
- `context` - If not specified the default will be e164.
- `options`
  - `b` - Bypass the internal DUNDi cache

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_DUNDIRESULT

DUNDIRESULT()

Synopsis

Retrieve results from a DUNDIQUERY.

Description

This function will retrieve results from a previous use of the DUNDIQUERY function.

Syntax

DUNDIRESULT(id,resultnum)

Arguments

- id - The identifier returned by the DUNDIQUERY function.
- resultnum
  - number - The number of the result that you want to retrieve, this starts at 1
  - getnum - The total number of results that are available.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ENUMLOOKUP

**ENUMLOOKUP()**

**Synopsis**

General or specific querying of NAPTR records for ENUM or ENUM-like DNS pointers.

**Description**

For more information see doc/AST.pdf.

**Syntax**

```plaintext
ENUMLOOKUP(number,method-type,options,record#,zone-suffix)
```

**Arguments**

- **number**
- **method-type** - If no `method-type` is given, the default will be `sip`.
- **options**
  - `c` - Returns an integer count of the number of NAPTRs of a certain RR type.
    Combination of `c` and `method-type` of `ALL` will return a count of all NAPTRs for the record or `-1` on error.
  - `u` - Returns the full URI and does not strip off the URI-scheme.
  - `s` - Triggers ISN specific rewriting.
  - `i` - Looks for branches into an Infrastructure ENUM tree.
  - `d` - for a direct DNS lookup without any flipping of digits.
- **record#** - If no `record#` is given, defaults to `1`.
- **zone-suffix** - If no `zone-suffix` is given, the default will be `e164.arpa`

**See Also**

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ENUMQUERY

ENUMQUERY()

Synopsis
Initiate an ENUM query.

Description
This will do a ENUM lookup of the given phone number.

Syntax

```
ENUMQUERY(number,method-type,zone-suffix)
```

Arguments

- **number**
- **method-type** - If no method-type is given, the default will be sip.
- **zone-suffix** - If no zone-suffix is given, the default will be e164.arpa

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ENUMRESULT

ENUMRESULT()

Synopsis
Retrieve results from a ENUMQUERY.

Description
This function will retrieve results from a previous use of the ENUMQUERY function.

Syntax

```
ENUMRESULT(id,resultnum)
```

Arguments
- `id` - The identifier returned by the ENUMQUERY function.
- `resultnum` - The number of the result that you want to retrieve.

Results start at 1. If this argument is specified as `getnum`, then it will return the total number of results that are available or -1 on error.

Asterisk 14 Function_ENV

ENV()

Synopsis

 Gets or sets the environment variable specified.

Description

 Variables starting with AST_ are reserved to the system and may not be set.

Syntax

```
ENV(varname)
```

Arguments

- `varname` - Environment variable name

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_EVAL

EVAL()

Synopsis
Evaluate stored variables

Description
Using EVAL basically causes a string to be evaluated twice. When a variable or expression is in the dialplan, it will be evaluated at runtime. However, if the results of the evaluation is in fact another variable or expression, using EVAL will have it evaluated a second time.

Example: If the MYVAR contains OTHERVAR, then the result of ${EVAL( MYVAR)} in the dialplan will be the contents of OTHERVAR. Normally just putting MYVAR in the dialplan the result would be OTHERVAR.

Syntax
EVAL(variable)

Arguments
- variable

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
**Asterisk 14 Function_EXCEPTION**

**EXCEPTION()**

**Synopsis**
Retrieve the details of the current dialplan exception.

**Description**
Retrieve the details (specified field) of the current dialplan exception.

**Syntax**
```
EXCEPTION(field)
```

**Arguments**
- **field** - The following fields are available for retrieval:
  - **reason** - INVALID, ERROR, RESPONSETIMEOUT, ABSOLUTETIMEOUT, or custom value set by the RaiseException() application
  - **context** - The context executing when the exception occurred.
  - **exten** - The extension executing when the exception occurred.
  - **priority** - The numeric priority executing when the exception occurred.

**See Also**
- Asterisk 14 Application.RaiseException

**Import Version**
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_EXISTS

 EXISTS()

Synopsis

Test the existence of a value.

Description

Returns 1 if exists, 0 otherwise.

Syntax

```
EXISTS(data)
```

Arguments

* data

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_EXTENSION_STATE

EXTENSION_STATE()

Synopsis

Get an extension's state.

Description

The EXTENSION_STATE function can be used to retrieve the state from any hinted extension. For example:

NoOp(1234@default has state ${EXTENSION_STATE(1234)})
NoOp(4567@home has state ${EXTENSION_STATE(4567@home)})

The possible values returned by this function are:

UNKNOWN | NOT_INUSE | INUSE | BUSY | INVALID | UNAVAILABLE | RINGING | RINGINUSE | HOLDINUSE | ONHOLD

Syntax

EXTENSION_STATE(extension@context)

Arguments

- extension
- context - If it is not specified defaults to default.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FAXOPT_res_fax

FAXOPT() - [res_fax]

Synopsis

Gets/sets various pieces of information about a fax session.

Description

FAXOPT can be used to override the settings for a FAX session listed in res_fax.conf, it can also be used to retrieve information about a FAX session that has finished eg. pages/status.

Syntax

FAXOPT(item)

Arguments

- item
  - ecm - R/W Error Correction Mode (ECM) enable with 'yes', disable with 'no'.
  - error - R/O FAX transmission error code upon failure.
  - filename - R/O Filename of the first file of the FAX transmission.
  - filenames - R/O Filenames of all of the files in the FAX transmission (comma separated).
  - headerinfo - R/W FAX header information.
  - localstationid - R/W Local Station Identification.
  - minrate - R/W Minimum transfer rate set before transmission.
  - maxrate - R/W Maximum transfer rate set before transmission.
  - modem - R/W Modem type (v17/v27/v29).
  - gateway - R/W T38 fax gateway, with optional fax activity timeout in seconds (yes[,timeout]/no)
  - faxdetect - R/W Enable FAX detect with optional timeout in seconds (yes,t38,cng[,timeout]/no)
  - pages - R/O Number of pages transferred.
  - rate - R/O Negotiated transmission rate.
  - remotestationid - R/O Remote Station Identification after transmission.
  - resolution - R/O Negotiated image resolution after transmission.
  - sessionid - R/O Session ID of the FAX transmission.
  - status - R/O Result Status of the FAX transmission.
  - statusstr - R/O Verbose Result Status of the FAX transmission.
  - t38timeout - R/W The timeout used for T.38 negotiation.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FEATURE

FEATURE()

Synopsis
Get or set a feature option on a channel.

Description
When this function is used as a read, it will get the current value of the specified feature option for this channel. It will be the value of this option configured in features.conf if a channel specific value has not been set. This function can also be used to set a channel specific value for the supported feature options.

Syntax
```
FEATURE(option_name)
```

Arguments
- **option_name** - The allowed values are:
  - **inherit** - Inherit feature settings made in FEATURE or FEATUREMAP to child channels.
  - **featuredigittimeout** - Milliseconds allowed between digit presses when entering a feature code.
  - **transferdigittimeout** - Seconds allowed between digit presses when dialing a transfer destination
  - **atxfernoanswertimeout** - Seconds to wait for attended transfer destination to answer
  - **atxferdropcall** - Hang up the call entirely if the attended transfer fails
  - **atxferloopdelay** - Seconds to wait between attempts to re-dial transfer destination
  - **atxfercallbackretries** - Number of times to re-attempt dialing a transfer destination
  - **xfersound** - Sound to play to during transfer and transfer-like operations.
  - **xferfailsound** - Sound to play to a transferee when a transfer fails
  - **atxferabort** - Digits to dial to abort an attended transfer attempt
  - **atxfercomplete** - Digits to dial to complete an attended transfer
  - **atxferthreeway** - Digits to dial to change an attended transfer into a three-way call
  - **pickupexten** - Digits used for picking up ringing calls
  - **pickupsound** - Sound to play to picker when a call is picked up
  - **pickupfailsound** - Sound to play to picker when a call cannot be picked up
  - **courtesytone** - Sound to play when automon or automixmon is activated
  - **recordingfailsound** - Sound to play when automon or automixmon is attempted but fails to start
  - **transferdialattempts** - Number of dial attempts allowed when attempting a transfer
  - **transferretrysound** - Sound that is played when an incorrect extension is dialed and the transferer should try again.
  - **transferinvalidsound** - Sound that is played when an incorrect extension is dialed and the transferer has no attempts remaining.

See Also
- Asterisk 14 Function_FEATUREMAP

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FEATUREMAP

FEATUREMAP()

Synopsis

Get or set a feature map to a given value on a specific channel.

Description

When this function is used as a read, it will get the current digit sequence mapped to the specified feature for this channel. This value will be the one configured in features.conf if a channel specific value has not been set. This function can also be used to set a channel specific value for a feature mapping.

Syntax

```plaintext
FEATUREMAP(feature_name)
```

Arguments

- **feature_name** - The allowed values are:
  - `atxfer` - Attended Transfer
  - `blindxfer` - Blind Transfer
  - `automon` - Auto Monitor
  - `disconnect` - Call Disconnect
  - `parkcall` - Park Call
  - `automixmon` - Auto MixMonitor

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FIELDNUM

FIELDNUM()

Synopsis

Return the 1-based offset of a field in a list

Description

Search the variable named varname for the string value delimited by delim and return a 1-based offset as to its location. If not found or an error occurred, return 0.

The delimiter may be specified as a special or extended ASCII character, by encoding it. The characters \n, \r, and \t are all recognized as the newline, carriage return, and tab characters, respectively. Also, octal and hexadecimal specifications are recognized by the patterns \0nnn and \xHH, respectively. For example, if you wanted to encode a comma as the delimiter, you could use either \054 or \x2C.

Example: If ${example} contains ex-amp-le, then ${FIELDNUM(example,-,amp)} returns 2.

Syntax

FIELDNUM(varname,delim,value)

Arguments

• varname
• delim
• value

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FIELDQTY

FIELDQTY()

Synopsis

Count the fields with an arbitrary delimiter

Description

The delimiter may be specified as a special or extended ASCII character, by encoding it. The characters \n, \r, and \t are all recognized as the newline, carriage return, and tab characters, respectively. Also, octal and hexadecimal specifications are recognized by the patterns \0nnn and \xHH, respectively. For example, if you wanted to encode a comma as the delimiter, you could use either \054 or \x2C.

Example: If ${example} contains ex-amp-le, then ${FIELDQTY(example,:) returns 3.

Syntax

FIELDQTY(varname,delim)

Arguments

- varname
- delim

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FILE

FILE()

Synopsis
Read or write text file.

Description
Read and write text file in character and line mode.

Examples:
Read mode (byte):
; reads the entire content of the file.
Set(foo=${FILE(/tmp/test.txt)})
; reads from the 11th byte to the end of the file (i.e. skips the first 10).
Set(foo=${FILE(/tmp/test.txt,10)})
; reads from the 11th to 20th byte in the file (i.e. skip the first 10, then read 10 bytes).
Set(foo=${FILE(/tmp/test.txt,10,10)})
Read mode (line):
; reads the 3rd line of the file.
Set(foo=${FILE(/tmp/test.txt,3,1,l)})
; reads the 3rd and 4th lines of the file.
Set(foo=${FILE(/tmp/test.txt,3,2,l)})
; reads from the third line to the end of the file.
Set(foo=${FILE(/tmp/test.txt,3,,l)})
; reads the last three lines of the file.
Set(foo=${FILE(/tmp/test.txt,-3,,l)})
; reads the 3rd line of a DOS-formatted file.
Set(foo=${FILE(/tmp/test.txt,3,1,l,d)})
Write mode (byte):
; truncate the file and write "bar"
Set(FILE(/tmp/test.txt)=bar)
; Append "bar"
Set(FILE(/tmp/test.txt,,,a)=bar)
; Replace the first byte with "bar" (replaces 1 character with 3)
Set(FILE(/tmp/test.txt,0,1)=bar)
; Replace 10 bytes beginning at the 21st byte of the file with "bar"
Set(FILE(/tmp/test.txt,20,10)=bar)
; Replace all bytes from the 21st with "bar"
Set(FILE(/tmp/test.txt,20)=bar)
; Insert "bar" after the 4th character
Set(FILE(/tmp/test.txt,4,0)=bar)
Write mode (line):
; Replace the first line of the file with "bar"
Set(FILE(/tmp/foo.txt,0,1,l)=bar)
; Replace the last line of the file with "bar"
Set(FILE(/tmp/foo.txt,-1,,l)=bar)
; Append "bar" to the file with a newline
Set(FILE(/tmp/foo.txt,,,al)=bar)

**Note**
If `live_dangerously` in `asterisk.conf` is set to `no`, this function can only be executed from the dialplan, and not directly from external protocols.

**Syntax**

```c
FILE(filename,offset,length,options,format)
```

**Arguments**

- `filename`
- `offset` - Maybe specified as any number. If negative, `offset` specifies the number of bytes back from the end of the file.
- `length` - If specified, will limit the length of the data read to that size. If negative, trims `length` bytes from the end of the file.
- `options`
  - `l` - Line mode: offset and length are assumed to be measured in lines, instead of byte offsets.
  - `a` - In write mode only, the append option is used to append to the end of the file, instead of overwriting the existing file.
  - `d` - In write mode and line mode only, this option does not automatically append a newline string to the end of a value. This is useful for deleting lines, instead of setting them to blank.
- `format` - The `format` parameter may be used to delimit the type of line terminators in line mode.
  - `u` - Unix newline format.
  - `d` - DOS newline format.
  - `m` - Macintosh newline format.

**See Also**

- Asterisk 14 Function `FILE_COUNT_LINE`
- Asterisk 14 Function `FILE_FORMAT`

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FILE_COUNT_LINE

FILE_COUNT_LINE()

Synopsis

Obtains the number of lines of a text file.

Description

Returns the number of lines, or -1 on error.

Note

If live_dangerously in asterisk.conf is set to no, this function can only be executed from the dialplan, and not directly from external protocols.

Syntax

FILE_COUNT_LINE(filename,format)

Arguments

- filename
- format - Format may be one of the following:
  - u - Unix newline format.
  - d - DOS newline format.
  - m - Macintosh newline format.

Note

If not specified, an attempt will be made to determine the newline format type.

See Also

- Asterisk 14 Function_FILE_FORMAT

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FILE_FORMAT

FILE_FORMAT()

Synopsis
Return the newline format of a text file.

Description
Return the line terminator type:
'\u' - Unix "\n" format
'd' - DOS "\r\n" format
'm' - Macintosh "\r" format
'x' - Cannot be determined

Syntax
FILE_FORMAT(filename)

Arguments
- filename

See Also
- Asterisk 14 Function_FILE
- Asterisk 14 Function_FILE_COUNT_LINE

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FILTER

FILTER()

Synopsis

Filter the string to include only the allowed characters

Description

Permits all characters listed in allowed-chars, filtering all others outs. In addition to literally listing the characters, you may also use ranges of characters (delimited by a –

Hexadecimal characters started with a \x (i.e. \x20)

Octal characters started with a \0 (i.e. \040)

Also \t, \n and \r are recognized.

WARNING

If you want the – character it needs to be prefixed with a {{}}

Syntax

FILTER(allowed-chars,string)

Arguments

- allowed-chars
- string

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_FRAME_TRACE

FRAME_TRACE()

Synopsis

View internal ast_frames as they are read and written on a channel.

Description

Examples:

exten => 1,1,Set(FRAME_TRACE(white)=DTMF_BEGIN,DTMF_END); view only DTMF frames.
exten => 1,1,Set(FRAME_TRACE()=DTMF_BEGIN,DTMF_END); view only DTMF frames.
exten => 1,1,Set(FRAME_TRACE(black)=DTMF_BEGIN,DTMF_END); view everything except DTMF frames.

Syntax

FRAME_TRACE(filter list type)

Arguments

- filter list type - A filter can be applied to the trace to limit what frames are viewed. This filter can either be a white or black list of frame types. When no filter type is present, white is used. If no arguments are provided at all, all frames will be output. Below are the different types of frames that can be filtered.
  - DTMF_BEGIN
  - DTMF_END
  - VOICE
  - VIDEO
  - CONTROL
  - NULL
  - IAX
  - TEXT
  - IMAGE
  - HTML
  - CNG
  - MODEM

Asterisk 14 Function_GLOBAL

GLOBAL()

Synopsis

Gets or sets the global variable specified.

Description

Set or get the value of a global variable specified in varname

Syntax

GLOBAL(varname)

Arguments

- varname - Global variable name

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_GROUP

GROUP()

Synopsis

Gets or sets the channel group.

Description

category can be employed for more fine grained group management. Each channel can only be member of exactly one group per category.

Syntax

```
GROUP(category)
```

Arguments

- `category` - Category name.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_GROUP_COUNT

GROUP_COUNT()

Synopsis
Counts the number of channels in the specified group.

Description
Calculates the group count for the specified group, or uses the channel's current group if not specified (and non-empty).

Syntax

GROUP_COUNT(groupname@category)

Arguments

- groupname - Group name.
- category - Category name

See Also

Asterisk 14 Function

GROUP_LIST()

Synopsis

Gets a list of the groups set on a channel.

Description

Gets a list of the groups set on a channel.

Syntax

GROUP_LIST()

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_GROUP_MATCH_COUNT

GROUP_MATCH_COUNT()

Synopsis
Counts the number of channels in the groups matching the specified pattern.

Description
Calculates the group count for all groups that match the specified pattern. Note: category matching is applied after matching based on group. Uses standard regular expression matching on both (see regex(7)).

Syntax

```
GROUP_MATCH_COUNT(groupmatch@category)
```

Arguments
- `groupmatch` - A standard regular expression used to match a group name.
- `category` - A standard regular expression used to match a category name.

Asterisk 14 Function_HANGUPCAUSE

HANGUPCAUSE()

Synopsis

Gets per-channel hangupcause information from the channel.

Description

Gets technology-specific or translated Asterisk cause code information from the channel for the specified channel that resulted from a dial.

Syntax

HANGUPCAUSE(channel, type)

Arguments

- channel - The name of the channel for which to retrieve cause information.
- type - Parameter describing which type of information is requested. Types are:
  - tech - Technology-specific cause information
  - ast - Translated Asterisk cause code

See Also

- Asterisk 14 Function_HANGUPCAUSE_KEYS
- Asterisk 14 Application_HangupCauseClear

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_HANGUPCAUSE_KEYSS

HANGUPCAUSE_KEYSS()

Synopsis

Gets the list of channels for which hangup causes are available.

Description

Returns a comma-separated list of channel names to be used with the HANGUPCAUSE function.

Syntax

See Also

- Asterisk 14 Function_HANGUPCAUSE
- Asterisk 14 Application_HangupCauseClear

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_HASH

HASH()

Synopsis
Implementation of a dialplan associative array

Description
In two arguments mode, gets and sets values to corresponding keys within a named associative array. The single-argument mode will only work when assigned to from a function defined by func_odbc

Syntax

| HASH(hashname,hashkey) |

Arguments
- hashname
- hashkey

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_HASHKEYS

HASHKEYS()

Synopsis
Retrieve the keys of the HASH() function.

Description
Returns a comma-delimited list of the current keys of the associative array defined by the HASH() function. Note that if you iterate over the keys of the result, adding keys during iteration will cause the result of the HASHKEYS() function to change.

Syntax

HASHKEYS(hashname)

Arguments

- hashname

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_HINT

HINT()

Synopsis

Get the devices set for a dialplan hint.

Description

The HINT function can be used to retrieve the list of devices that are mapped to a dialplan hint. For example:

```
NoOp(Hint for Extension 1234 is ${HINT(1234)})
```

Syntax

```
HINT(extension, options)
```

Arguments

- **extension**
  - extension
  - context
- **options**
  - n - Retrieve name on the hint instead of list of devices.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_HOLD_INTERCEPT

HOLD_INTERCEPT()

Synopsis

Intercepts hold frames on a channel and raises an event instead of passing the frame on

Description

Syntax

<table>
<thead>
<tr>
<th>HOLD_INTERCEPT(action)</th>
</tr>
</thead>
</table>

Arguments

- **action**
  - **remove** - W/O. Removes the hold interception function.
  - **set** - W/O. Enable hold interception on the channel. When enabled, the channel will intercept any hold action that is signalled from the device, and instead simply raise an event (AMI/ARI) indicating that the channel wanted to put other parties on hold.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_IAXPEER

IAXPEER()

Synopsis

Gets IAX peer information.

Description

Gets information associated with the specified IAX2 peer.

Syntax

```
IAXPEER(peername, item)
```

Arguments

- **peername**
  - CURRENT_CHANNEL - If *peername* is specified to this value, return the IP address of the endpoint of the current channel
- **item** - If *peername* is specified, valid items are:
  - **ip** - (default) The IP address.
  - **status** - The peer's status (if qualify=yes)
  - **mailbox** - The configured mailbox.
  - **context** - The configured context.
  - **expire** - The epoch time of the next expire.
  - **dynamic** - Is it dynamic? (yes/no).
  - **callerid_name** - The configured Caller ID name.
  - **callerid_num** - The configured Caller ID number.
  - **codecs** - The configured codecs.
  - **codec** - Preferred codec index number x (beginning with 0)

See Also

- Asterisk 14 Function_SIPPEER

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_IAXVAR

IAXVAR()

Synopsis
Sets or retrieves a remote variable.

Description
Gets or sets a variable that is sent to a remote IAX2 peer during call setup.

Syntax

IAXVAR(varname)

Arguments

- varname

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ICONV

ICONV()

Synopsis

Converts charsets of strings.

Description

Converts string from \texttt{in-charset} into \texttt{out-charset}. For available charsets, use \texttt{iconv -l} on your shell command line.

\begin{itemize}
  \item \texttt{in-charset} - Input charset
  \item \texttt{out-charset} - Output charset
  \item \texttt{string} - String to convert, from \texttt{in-charset} to \texttt{out-charset}
\end{itemize}

\begin{warning}
Due to limitations within the API, ICONV will not currently work with charsets with embedded NULLs. If found, the string will terminate.
\end{warning}

Syntax

\begin{verbatim}
ICONV (in-charset, out-charset, string)
\end{verbatim}

Arguments

- \texttt{in-charset} - Input charset
- \texttt{out-charset} - Output charset
- \texttt{string} - String to convert, from \texttt{in-charset} to \texttt{out-charset}

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_IF

IF()

Synopsis
Check for an expresion.

Description
Returns the data following ? if true, else the data following :

Syntax

```
IF(expression?retvalue)
```

Arguments

- expression
- retvalue
  - true
  - false

See Also

Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Function_IFMODULE

IFMODULE()

Synopsis
Checks if an Asterisk module is loaded in memory.

Description
Checks if a module is loaded. Use the full module name as shown by the list in module list. Returns 1 if module exists in memory, otherwise 0.

Syntax

```
IFMODULE(modulename.so)
```

Arguments
- modulename.so - Module name complete with .so

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_IFTIME

IFTIME()

Synopsis
Temporal Conditional.

Description
Returns the data following ? if true, else the data following :

Syntax

```
IFTIME(timespec?retvalue)
```

Arguments

- timespec
- retvalue
  - true
  - false

See Also

Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Function _IMPORT

IMPORT()

Synopsis
Retrieve the value of a variable from another channel.

Description

Syntax

```
IMPORT(channel, variable)
```

Arguments

- channel
- variable

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function INC

INC()

Synopsis
Increments the value of a variable, while returning the updated value to the dialplan

Description
Increments the value of a variable, while returning the updated value to the dialplan
Example: INC(MyVAR) - Increments MyVar
Note: INC(${MyVAR}) - Is wrong, as INC expects the variable name, not its value

Syntax
```
INC(variable)
```

Arguments
- **variable**: The variable name to be manipulated, without the braces.

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ISNULL

ISNULL()

Synopsis
Check if a value is NULL.

Description
Returns 1 if NULL or 0 otherwise.

Syntax

```
ISNULL(data)
```

Arguments

- data

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_JABBER_RECEIVE_res xmpp

JABBER_RECEIVE() - [res xmpp]

Synopsis

Reads XMPP messages.

Description

Receives a text message on the given account from the buddy identified by jid and returns the contents.

Example: $(JABBER_RECEIVE(asterisk,bob@domain.com)) returns an XMPP message sent from bob@domain.com (or nothing in case of a time out), to the asterisk XMPP account configured in xmpp.conf.

Syntax

JABBER_RECEIVE(account,jid,timeout)

Arguments

- account - The local named account to listen on (specified in xmpp.conf)
- jid - Jabber ID of the buddy to receive message from. It can be a bare JID (username@domain) or a full JID (username@domain/resource).
- timeout - In seconds, defaults to 20.

See Also

- Asterisk 14 Function_JABBER_STATUS_res xmpp
- Asterisk 14 Application_JabberSend_res xmpp

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_JABBER_STATUS_res_xmpp

JABBER_STATUS() - [res_xmpp]

Synopsis
Retrieves a buddy's status.

Description
Retrieves the numeric status associated with the buddy identified by jid. If the buddy does not exist in the buddylist, returns 7.

Status will be 1-7.
1=Online, 2=Chatty, 3=Away, 4=XAway, 5=DND, 6=Offline
If not in roster variable will be set to 7.

Example: ${JABBER_STATUS(asterisk,bob@domain.com)} returns 1 if bob@domain.com is online. asterisk is the associated XMPP account configured in xmpp.conf.

Syntax

```
JABBER_STATUS(account,jid)
```

Arguments

- `account` - The local named account to listen on (specified in xmpp.conf)
- `jid` - Jabber ID of the buddy to receive message from. It can be a bare JID (username@domain) or a full JID (username@domain/resource).

See Also

- Asterisk 14 Function_JABBER_RECEIVE_res_xmpp
- Asterisk 14 Application_JabberSend_res_xmpp

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_JITTERBUFFER

JITTERBUFFER()

Synopsis
Add a Jitterbuffer to the Read side of the channel. This dejitters the audio stream before it reaches the Asterisk core. This is a write only function.

Description
Jitterbuffers are constructed in two different ways. The first always take three arguments: max_size, resync_threshold, and target_extra. Alternatively, a single argument of default can be provided, which will construct the default jitterbuffer for the given jitterbuffer type.

The arguments are:
max_size: Length in milliseconds of the buffer. Defaults to 200 ms.
resync_threshold: The length in milliseconds over which a timestamp difference will result in resyncing the jitterbuffer. Defaults to 1000ms.
target_extra: This option only affects the adaptive jitterbuffer. It represents the amount time in milliseconds by which the new jitter buffer will pad its size. Defaults to 40ms.

Example: Fixed with defaults

```text
exten => 1,1,Set(JITTERBUFFER(fixed)=default)
```

Example: Fixed with 200ms max size

```text
exten => 1,1,Set(JITTERBUFFER(fixed)=200)
```

Example: Fixed with 200ms max size, resync threshold 1500

```text
exten => 1,1,Set(JITTERBUFFER(fixed)=200,1500)
```

Example: Adaptive with defaults

```text
exten => 1,1,Set(JITTERBUFFER(adaptive)=default)
```

Example: Adaptive with 200ms max size, 60ms target extra

```text
exten => 1,1,Set(JITTERBUFFER(adaptive)=200,,60)
```
Example: Set a fixed jitterbuffer with defaults; then remove it

```
exten => 1,1,Set(JITTERBUFFER(fixed)=default)
```
```
exten => 1,n,Set(JITTERBUFFER(disabled)=)
```

**Note**

If a channel specifies a jitterbuffer due to channel driver configuration and the JITTERBUFFER function has set a jitterbuffer for that channel, the jitterbuffer set by the JITTERBUFFER function will take priority and the jitterbuffer set by the channel configuration will not be applied.

**Syntax**

```
JITTERBUFFER(jitterbuffer type)
```

**Arguments**

- **jitterbuffer type**
  - `fixed` - Set a fixed jitterbuffer on the channel.
  - `adaptive` - Set an adaptive jitterbuffer on the channel.
  - `disabled` - Remove a previously set jitterbuffer from the channel.

**See Also**

**Import Version**

This documentation was imported from Asterisk Version GIT-14-46b4e67
Asterisk 14 Function_KEYPADHASH

KEYPADHASH()

Synopsis
Hash the letters in string into equivalent keypad numbers.

Description
Example: ${KEYPADHASH(Les)} returns "537"

Syntax

```
KEYPADHASH(string)
```

Arguments
- string

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_LEN

LEN()

Synopsis
Return the length of the string given.

Description

Example: ${LEN(example)} returns 7

Syntax

LEN(string)

Arguments

• string

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_LISTFILTER

LISTFILTER()

Synopsis

Remove an item from a list, by name.

Description

Remove value from the list contained in the varname variable, where the list delimiter is specified by the delim parameter. This is very useful for removing a single channel name from a list of channels, for example.

Syntax

```
LISTFILTER(varname,delim,value)
```

Arguments

- varname
- delim
- value

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_LOCAL

LOCAL()

Synopsis

Manage variables local to the gosub stack frame.

Description

Read and write a variable local to the gosub stack frame, once we Return() it will be lost (or it will go back to whatever value it had before the Gosub()).

Syntax

```
LOCAL(varname)
```

Arguments

- `varname`

See Also

- Asterisk 14 Application_Gosub
- Asterisk 14 Application_GosubIf
- Asterisk 14 Application_Return

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_LOCAL_PEEK

LOCAL_PEEK()

Synopsis
Retrieve variables hidden by the local gosub stack frame.

Description
Read a variable varname hidden by $ levels of gosub stack frames. Note that $LOCAL_PEEK(0,foo)) is the same as foo, since the value of $ peeks under 0 levels of stack frames; in other words, 0 is the current level. If $ exceeds the available number of stack frames, then an empty string is returned.

Syntax

```
LOCAL_PEEK(n, varname)
```

Arguments

- n
- varname

See Also

- Asterisk 14 Application_Gosub
- Asterisk 14 Application_GosubIf
- Asterisk 14 Application_Return

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_LOCK

LOCK()

Synopsis

Attempt to obtain a named mutex.

Description

Attempts to grab a named lock exclusively, and prevents other channels from obtaining the same lock. LOCK will wait for the lock to become available. Returns 1 if the lock was obtained or 0 on error.

Note

To avoid the possibility of a deadlock, LOCK will only attempt to obtain the lock for 3 seconds if the channel already has another lock.

Note

If `live_dangerously` in asterisk.conf is set to no, this function can only be executed from the dialplan, and not directly from external protocols.

Syntax

```
LOCK(lockname)
```

Arguments

- `lockname`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MAILBOX_EXISTS

MAILBOX_EXISTS()

Synopsis
Tell if a mailbox is configured.

Description

Returns a boolean of whether the corresponding mailbox exists. If context is not specified, defaults to the default context.

Syntax

MAILBOX_EXISTS(mailbox@context)

Arguments

- mailbox
- context

See Also

- Asterisk 14 Function_VM_INFO

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164

Note
DEPRECATED. Use VM_INFO(mailbox[@context].exists) instead.
Asterisk 14 Function_MASTER_CHANNEL

MASTER_CHANNEL()

Synopsis

Gets or sets variables on the master channel

Description

Allows access to the channel which created the current channel, if any. If the channel is already a master channel, then accesses local channel variables.

Syntax

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MATH

MATH()

Synopsis
Performs Mathematical Functions.

Description
Performs mathematical functions based on two parameters and an operator. The returned value type is type

Example: Set(i=${MATH(123%16,int)}) - sets var i=11

Syntax

```
MATH(expression,type)
```

Arguments

- **expression** - Is of the form: `number1opnumber2` where the possible values for `op` are: `+,-,*,/,%,,<<,>>,^,AND,OR,XOR,>,<,>,>=,==` (and behave as their C equivalents)
- **type** - Wanted type of result:
  - f, float - float (default)
  - i, int - integer
  - h, hex - hex
  - c, char - char

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MD5

MD5()

Synopsis
Computes an MD5 digest.

Description
Computes an MD5 digest.

Syntax

```
MD5(data)
```

Arguments

- **data**

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MEETME_INFO

MEETME_INFO()

Synopsis
Query a given conference of various properties.

Description

Syntax

```
MEETME_INFO(keyword,confno)
```

Arguments

- keyword - Options:
  - lock - Boolean of whether the corresponding conference is locked.
  - parties - Number of parties in a given conference
  - activity - Duration of conference in seconds.
  - dynamic - Boolean of whether the corresponding conference is dynamic.
- confno - Conference number to retrieve information from.

Asterisk 14 Function_MESSAGE

MESSAGE()

Synopsis

Create a message or read fields from a message.

Description

This function will read from or write a value to a text message. It is used both to read the data out of an incoming message, as well as modify or create a message that will be sent outbound.

Syntax

```
MESSAGE(argument)
```

Arguments

- `argument` - Field of the message to get or set.
- `to` - Read-only. The destination of the message. When processing an incoming message, this will be set to the destination listed as the recipient of the message that was received by Asterisk.
- `from` - Read-only. The source of the message. When processing an incoming message, this will be set to the source of the message.
- `custom_data` - Write-only. Mark or unmark all message headers for an outgoing message. The following values can be set:
  - `mark_all_outbound` - Mark all headers for an outgoing message.
  - `clear_all_outbound` - Unmark all headers for an outgoing message.
- `body` - Read/Write. The message body. When processing an incoming message, this includes the body of the message that Asterisk received. When MessageSend() is executed, the contents of this field are used as the body of the outgoing message. The body will always be UTF-8.

See Also

- Asterisk 14 Application_MessageSend

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function MESSAGE_DATA

MESSAGE_DATA()

Synopsis
Read or write custom data attached to a message.

Description
This function will read from or write a value to a text message. It is used both to read the data out of an incoming message, as well as modify a message that will be sent outbound.

Note
If you want to set an outbound message to carry data in the current message, do Set(MESSAGE_DATA(key)=${MESSAGE_DATA(key)}).

Syntax

```plaintext
MESSAGE_DATA(argument)
```

Arguments
- `argument` - Field of the message to get or set.

See Also
- Asterisk 14 Application MessageSend

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MINIVMACCOUNT

MINIVMACCOUNT()

Synopsis

Gets MiniVoicemail account information.

Description

Syntax

MINIVMACCOUNT(account:item)

Arguments

- **account**: Valid items are:
  - path - Path to account mailbox (if account exists, otherwise temporary mailbox).
  - hasaccount - 1 is static Minivm account exists, 0 otherwise.
  - fullname - Full name of account owner.
  - email - Email address used for account.
  - etemplate - Email template for account (default template if none is configured).
  - ptemplate - Pager template for account (default template if none is configured).
  - accountcode - Account code for the voicemail account.
  - pincode - Pin code for voicemail account.
  - timezone - Time zone for voicemail account.
  - language - Language for voicemail account.
  - <channel variable name> - Channel variable value (set in configuration for account).

Asterisk 14 Function_MINIVM_COUNTER

MINIVM_COUNTER()

Synopsis

Reads or sets counters for MiniVoicemail message.

Description

The operation is atomic and the counter is locked while changing the value. The counters are stored as text files in the minivm account directories. It might be better to use realtime functions if you are using a database to operate your Asterisk.

Syntax

MINIVM_COUNTER(account:name:operand)

Arguments

- **account** - If account is given and it exists, the counter is specific for the account. If account is a domain and the domain directory exists, counters are specific for a domain.
- **name** - The name of the counter is a string, up to 10 characters.
- **operand** - The counters never goes below zero. Valid operands for changing the value of a counter when assigning a value are:
  - **i** - Increment by value.
  - **d** - Decrement by value.
  - **s** - Set to value.

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MIXMONITOR

MIXMONITOR()

Synopsis
Retrieve data pertaining to specific instances of MixMonitor on a channel.

Description

Syntax

```
MIXMONITOR(id,key)
```

Arguments

- **id**: The unique ID of the MixMonitor instance. The unique ID can be retrieved through the channel variable used as an argument to the `i` option to MixMonitor.
- **key**: The piece of data to retrieve from the MixMonitor.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_MUTEAUDIO

MUTEAUDIO()}

Synopsis

Muting audio streams in the channel

Description

The MUTEAUDIO function can be used to mute inbound (to the PBX) or outbound audio in a call.

Examples:

MUTEAUDIO(in)=on
MUTEAUDIO(in)=off

Syntax

MUTEAUDIO(direction)

Arguments

- direction - Must be one of
  - in - Inbound stream (to the PBX)
  - out - Outbound stream (from the PBX)
  - all - Both streams

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_ODBC

ODBC()

Synopsis

Controls ODBC transaction properties.

Description

The ODBC() function allows setting several properties to influence how a connected database processes transactions.

Syntax

```
ODBC(property[,argument])
```

Arguments

- **property**
  - **transaction** - Gets or sets the active transaction ID. If set, and the transaction ID does not exist and a database name is specified as an argument, it will be created.
  - **forcecommit** - Controls whether a transaction will be automatically committed when the channel hangs up. Defaults to false. If a transaction ID is specified in the optional argument, the property will be applied to that ID, otherwise to the current active ID.
  - **isolation** - Controls the data isolation on uncommitted transactions. May be one of the following: read_committed, read_uncommitted, repeatable_read, or serializable. Defaults to the database setting in res_odbc.conf or readcommitted if not specified. If a transaction ID is specified as an optional argument, it will be applied to that ID, otherwise the current active ID.

Asterisk 14 Function_ODBC_FETCH

ODBC_FETCH()

Synopsis

Fetch a row from a multirow query.

Description

For queries which are marked as mode=multirow, the original query returns a result-id from which results may be fetched. This function implements the actual fetch of the results.

This also sets ODBC_FETCH_STATUS.

- ODBC_FETCH_STATUS
  - SUCCESS - If rows are available.
  - FAILURE - If no rows are available.

Syntax

```
ODBC_FETCH(result-id)
```

Arguments

- result-id

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_PASSTHRU

PASSTHRU()

Synopsis

Pass the given argument back as a value.

Description

Literally returns the given string. The intent is to permit other dialplan functions which take a variable name as an argument to be able to take a literal string, instead.

Note

The functions which take a variable name need to be passed var and not ${var}. Similarly, use PASSTHRU() and not ${PASSTHRU()}.

Example: ${CHANNEL} contains SIP/321-1
${CUT(PASSTHRU(${CUT(CHANNEL,-,1)}),/2))} will return 321

Syntax

```
PASSTHRU([string])
```

Arguments

- string

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function PERIODIC_HOOK

PERIODIC_HOOK()

Synopsis
Execute a periodic dialplan hook into the audio of a call.

Description
For example, you could use this function to enable playing a periodic beep sound in a call.

To turn on:
Set(BEEPID=${PERIODIC_HOOK(hooks,beep,180)})

To turn off:
Set(PERIODIC_HOOK(${BEEPID})=off)

To turn back on again later:
Set(PERIODIC_HOOK(${BEEPID})=on)

It is important to note that the hook does not actually run on the channel itself. It runs asynchronously on a new channel. Any audio generated by the hook gets injected into the call for the channel PERIODIC_HOOK() was set on.

The hook dialplan will have two variables available. HOOK_CHANNEL is the channel the hook is enabled on. HOOK_ID is the hook ID for enabling or disabling the hook.

Syntax

```PERIODIC_HOOK(context,extension,interval,hook_id)```

Arguments
- `context` - (On Read Only) Context for the hook extension.
- `extension` - (On Read Only) The hook extension.
- `interval` - (On Read Only) Number of seconds in between hook runs. Whole seconds only.
- `hook_id` - (On Write Only) The hook ID.

Asterisk 14 Function_PITCH_SHIFT

PITCH_SHIFT()

Synopsis
Pitch shift both tx and rx audio streams on a channel.

Description
Examples:

exten => 1,1,Set(PITCH_SHIFT(tx)=highest); raises pitch an octave
exten => 1,1,Set(PITCH_SHIFT(rx)=higher) ; raises pitch more
exten => 1,1,Set(PITCH_SHIFT(both)=high) ; raises pitch
exten => 1,1,Set(PITCH_SHIFT(rx)=low) ; lowers pitch
exten => 1,1,Set(PITCH_SHIFT(tx)=lower) ; lowers pitch more
exten => 1,1,Set(PITCH_SHIFT(both)=lowest) ; lowers pitch an octave
exten => 1,1,Set(PITCH_SHIFT(rx)=0.8) ; lowers pitch
exten => 1,1,Set(PITCH_SHIFT(tx)=1.5) ; raises pitch

Syntax

PITCH_SHIFT(channel direction)

Arguments

- channel direction - Direction can be either rx, tx, or both. The direction can either be set to a valid floating point number between 0.1 and 4.0 or one of the enum values listed below. A value of 1.0 has no effect. Greater than 1 raises the pitch. Lower than 1 lowers the pitch.

The pitch amount can also be set by the following values

- highest
- higher
- high
- low
- lower
- lowest

Asterisk 14 Function_PJSIP_AOR

PJSIP_AOR()

Synopsis
Get information about a PJSIP AOR

Description

Syntax

```
PJSIP_AOR(name,field)
```

Arguments

- **name** - The name of the AOR to query.
- **field** - The configuration option for the AOR to query for. Supported options are those fields on the `aor` object in `pjsip.conf`.
  - `contact` - Permanent contacts assigned to AoR
  - `default_expiration` - Default expiration time in seconds for contacts that are dynamically bound to an AoR.
  - `mailboxes` - Allow subscriptions for the specified mailbox(es)
  - `voicemail_extension` - The voicemail extension to send in the NOTIFY Message-Account header
  - `maximum_expiration` - Maximum time to keep an AoR
  - `max_contacts` - Maximum number of contacts that can bind to an AoR
  - `minimum_expiration` - Minimum keep alive time for an AoR
  - `remove_existing` - Determines whether new contacts replace existing ones.
  - `type` - Must be of type 'aor'.
  - `qualify_frequency` - Interval at which to qualify an AoR
  - `qualify_timeout` - Timeout for qualify
  - `authenticate_qualify` - Authenticates a qualify request if needed
  - `outbound_proxy` - Outbound proxy used when sending OPTIONS request
  - `support_path` - Enables Path support for REGISTER requests and Route support for other requests.

Asterisk 14 Function_PJSIP_CONTACT

PJSIP_CONTACT()

Synopsis
Get information about a PJSIP contact

Description

Syntax

```
PJSIP_CONTACT(name,field)
```

Arguments

- **name** - The name of the contact to query.
- **field** - The configuration option for the contact to query for. Supported options are those fields on the `contact` object.
  - **type** - Must be of type 'contact'.
  - **uri** - SIP URI to contact peer
  - **expiration_time** - Time to keep alive a contact
  - **qualify_frequency** - Interval at which to qualify a contact
  - **qualify_timeout** - Timeout for qualify
  - **authenticate_qualify** - Authenticates a qualify request if needed
  - **outbound_proxy** - Outbound proxy used when sending OPTIONS request
  - **path** - Stored Path vector for use in Route headers on outgoing requests.
  - **user_agent** - User-Agent header from registration.
  - **endpoint** - Endpoint name
  - **reg_server** - Asterisk Server name
  - **via_addr** - IP-address of the last Via header from registration.
  - **via_port** - IP-port of the last Via header from registration.
  - **call_id** - Call-ID header from registration.

Asterisk 14 Function_PJSIP_DIAL_CONTACTS

PJSIP_DIAL_CONTACTS()

Synopsis
Return a dial string for dialing all contacts on an AOR.

Description
Returns a properly formatted dial string for dialing all contacts on an AOR.

Syntax

```
PJSIP_DIAL_CONTACTS(endpoint[, aor[, request_user]])
```

Arguments

- **endpoint** - Name of the endpoint
- **aor** - Name of an AOR to use, if not specified the configured AORs on the endpoint are used
- **request_user** - Optional request user to use in the request URI

See Also

Import Version

Asterisk 14 Function_PJSIP_ENDPOINT

PJSIP_ENDPOINT()

Synopsis
Get information about a PJSIP endpoint

Description

Syntax

```
PJSIP_ENDPOINT(name, field)
```

Arguments

- **name** - The name of the endpoint to query.
- **field** - The configuration option for the endpoint to query for. Supported options are those fields on the `endpoint` object in `pjsip.conf`:
  - `100rel` - Allow support for RFC3262 provisional ACK tags
  - `aggregate_mwi` - Condense MWI notifications into a single NOTIFY.
  - `allow` - Media Codec(s) to allow
  - `aors` - AoR(s) to be used with the endpoint
  - `auth` - Authentication Object(s) associated with the endpoint
  - `callerid` - CallerID information for the endpoint
  - `callerid_privacy` - Default privacy level
  - `callerid_tag` - Internal id_tag for the endpoint
  - `context` - Dialplan context for inbound sessions
  - `direct_media_glar_e_mitigation` - Mitigation of direct media (re)INVITE glare
  - `direct_media_method` - Direct Media method type
  - `connected_line_method` - Connected line method type
  - `direct_media` - Determines whether media may flow directly between endpoints.
  - `disable_direct_media_on_nat` - Disable direct media session refreshes when NAT obstructs the media session
  - `disallow` - Media Codec(s) to disallow
  - `dtmf_mode` - DTMF mode
  - `media_address` - IP address used in SDP for media handling
  - `bind_rtp_to_media_address` - Bind the RTP instance to the media_address
  - `force_rport` - Force use of return port
  - `ice_support` - Enable the ICE mechanism to help traverse NAT
  - `identify_by` - Way(s) for Endpoint to be identified
  - `redirect_method` - How redirects received from an endpoint are handled
  - `mailboxes` - NOTIFY the endpoint when state changes for any of the specified mailboxes
  - `mwi_subscribe_replaces_unsolicited` - An MWI subscribe will replace sending unsolicited NOTIFYs
  - `voicemail_extension` - The voicemail extension to send in the NOTIFY Message-Account header
  - `moh_suggest` - Default Music On Hold class
  - `outbound_auth` - Authentication object used for outbound requests
  - `rewrite_contact` - Allow Contact header to be rewritten with the source IP address-port
  - `rtp_ipv6` - Allow use of IPv6 for RTP traffic
  - `rtp_symmetric` - Enforce that RTP must be symmetric
  - `send_diversion` - Send the Diversion header, conveying the diversion information to the called user agent
  - `send_pai` - Send the P-Asserted-Identity header
  - `send_rpid` - Send the Remote-Party-ID header
  - `rpid_immediate` - Immediately send connected line updates on unanswered incoming calls.
  - `timers_min_se` - Minimum session timers expiration period
  - `timers` - Session timers for SIP packets
  - `timers_sess_expires` - Maximum session timer expiration period
  - `transport` - Desired transport configuration
  - `trust_id_inbound` - Accept identification information received from this endpoint
  - `trust_id_outbound` - Send private identification details to the endpoint.
  - `type` - Must be of type 'endpoint'.
  - `use_ptime` - Use Endpoint's requested packetisation interval
  - `use_avpf` - Determines whether res_pjsip will use and enforce usage of AVPF for this endpoint.
  - `force_avp` - Determines whether res_pjsip will use and enforce usage of AVP, regardless of the RTP profile in use for this endpoint.
  - `media_use_received_transport` - Determines whether res_pjsip will use the media transport received in the offer SDP in the corresponding answer SDP.
• **media_encryption** - Determines whether res_pjsip will use and enforce usage of media encryption for this endpoint.
• **media_encryption_optimistic** - Determines whether encryption should be used if possible but does not terminate the session if not achieved.
• **g726_non_standard** - Force g.726 to use AAL2 packing order when negotiating g.726 audio.
• **inband_progress** - Determines whether chan_pjsip will indicate ringing using inband progress.
• **call_group** - The numeric pickup groups for a channel.
• **pickup_group** - The numeric pickup groups that a channel can pickup.
• **named_call_group** - The named pickup groups for a channel.
• **named_pickup_group** - The named pickup groups that a channel can pickup.
• **device_state_busy_at** - The number of in-use channels which will cause busy to be returned as device state.
• **t38_udptl** - Whether T.38 UDPTL support is enabled or not.
• **t38_udptl_ec** - T.38 UDPTL error correction method.
• **t38_udptl_maxdatagram** - T.38 UDPTL maximum datagram size.
• **fax_detect** - Whether CNG tone detection is enabled.
• **fax_detect_timeout** - How long into a call before fax_detect is disabled for the call.
• **t38_udptl_nat** - Whether NAT support is enabled on UDPTL sessions.
• **t38_udptl_ipv6** - Whether IPv6 is used for UDPTL Sessions.
• **tone_zone** - Set which country's indications to use for channels created for this endpoint.
• **language** - Set the default language to use for channels created for this endpoint.
• **one_touch_recording** - Determines whether one-touch recording is allowed for this endpoint.
• **record_on_feature** - The feature to enact when one-touch recording is turned on.
• **record_off_feature** - The feature to enact when one-touch recording is turned off.
• **allow_t38_transfer** - Determines whether SIP REFER transfers are allowed for this endpoint.
• **user_eq_phone** - Determines whether a user=phone parameter is placed into the request URI if the user is determined to be a phone number.
• **moh_passthrough** - Determines whether hold and unhold will be passed through using re-INVITEs with recvonly and sendrecv to the remote side.
• **sdp_owner** - String placed as the username portion of an SDP origin (o=) line.
• **sdp_session** - String used for the SDP session (s=) line.
• **tos_audio** - DSCP TOS bits for audio streams.
• **tos_video** - DSCP TOS bits for video streams.
• **cos_audio** - Priority for audio streams.
• **cos_video** - Priority for video streams.
• **allow_subscribe** - Determines if endpoint is allowed to initiate subscriptions with Asterisk.
• **sub_min_expiry** - The minimum allowed expiry time for subscriptions initiated by the endpoint.
• **from_user** - Username to use in From header for requests to this endpoint.
• **mwi_from_user** - Username to use in From header for unsolicited MWI NOTIFYs to this endpoint.
• **from_domain** - Domain to use in From header for requests to this endpoint.
• **dtls_verify** - Verify that the provided peer certificate is valid.
• **dtls_rekey** - Interval at which to renegotiate the TLS session and rekey the SRTP session.
• **dtls_cert_file** - Path to certificate file to present to peer.
• **dtls_private_key** - Path to private key for certificate file.
• **dtls_cipher** - Cipher to use for DTLS negotiation.
• **dtls_ca_file** - Path to certificate authority certificate.
• **dtls_ca_path** - Path to a directory containing certificate authority certificates.
• **dtls_setup** - Whether we are willing to accept connections, connect to the other party, or both.
• **dtls_fingerprint** - Type of hash to use for the DTLS fingerprint in the SDP.
• **srtp_tag_32** - Determines whether 32 byte tags should be used instead of 80 byte tags.
• **set_var** - Variable set on a channel involving the endpoint.
• **message_context** - Context to route incoming MESSAGE requests to.
• **accountcode** - An accountcode to set automatically on any channels created for this endpoint.
• **rtp_keepalive** - Number of seconds between RTP comfort noise keepalive packets.
• **rtp_timeout** - Maximum number of seconds without receiving RTP (while off hold) before terminating call.
• **rtp_timeout_hold** - Maximum number of seconds without receiving RTP (while on hold) before terminating call.
• **acl** - List of IP ACL section names in acl.conf.
• **deny** - List of IP addresses to deny access from.
• **permit** - List of IP addresses to permit access from.
• **contact_acl** - List of Contact ACL section names in acl.conf.
• **contact_deny** - List of Contact header addresses to deny.
• **contact_permit** - List of Contact header addresses to permit.
• **subscribe_context** - Context for incoming MESSAGE requests.

Asterisk 14 Function_PJSIP_HEADER

PJSIP_HEADER()

Synopsis
Gets headers from an inbound PJSIP channel. Adds, updates or removes the specified SIP header from an outbound PJSIP channel.

Description
PJSIP_HEADER allows you to read specific SIP headers from the inbound PJSIP channel as well as write(add, update, remove) headers on the outbound channel. One exception is that you can read headers that you have already added on the outbound channel.

Examples:

; Set 'somevar' to the value of the 'From' header.
exen => 1,1,Set(somevar=${PJSIP_HEADER(read,From)})

; Set 'via2' to the value of the 2nd 'Via' header.
exen => 1,1,Set(via2=${PJSIP_HEADER(read,Via,2)})

; Add an 'X-Myheader' header with the value of 'myvalue'.
exen => 1,1,Set(PJSIP_HEADER(add,X-MyHeader)=myvalue)

; Add an 'X-Myheader' header with an empty value.
exen => 1,1,Set(PJSIP_HEADER(add,X-MyHeader)=)

; Update the value of the header named 'X-Myheader' to 'newvalue'.
; 'X-Myheader' must already exist or the call will fail.
exen => 1,1,Set(PJSIP_HEADER(update,X-MyHeader)=newvalue)

; Remove all headers whose names exactly match 'X-MyHeader'.
exen => 1,1,Set(PJSIP_HEADER(remove,X-MyHeader)=)

; Remove all headers that begin with 'X-My'.
exen => 1,1,Set(PJSIP_HEADER(remove,X-My*)=)

; Remove all previously added headers.
exen => 1,1,Set(PJSIP_HEADER(remove,*)=)

Note
The remove action can be called by reading or writing PJSIP_HEADER.

; Display the number of headers removed
exen => 1,1,Verbose( Removed ${PJSIP_HEADER(remove,X-MyHeader)} headers)
### Syntax

```
PJSIP_HEADER(action, name[, number])
```

### Arguments

- **action**
  - *read* - Returns instance number of header `name`.
  - *add* - Adds a new header `name` to this session.
  - *update* - Updates instance number of header `name` to a new value. The header must already exist.
  - *remove* - Removes all instances of previously added headers whose names match `name`. A `{}` may be appended to `name` to remove all headers *beginning with* `name`. `name` may be set to a single `{}` to clear *all* previously added headers. In all cases, the number of headers actually removed is returned.
- **name** - The name of the header.
- **number** - If there's more than 1 header with the same name, this specifies which header to read or update. If not specified, defaults to 1 meaning the first matching header. Not valid for `add` or `remove`.

### Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_PJSIP_MEDIA_OFFER

PJSIP_MEDIA_OFFER()

Synopsis
Media and codec offerings to be set on an outbound SIP channel prior to dialing.

Description
Returns the codecs offered based upon the media choice

Syntax
PJSIP_MEDIA_OFFER(media)

Arguments
- media - types of media offered

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_POP

POP()

Synopsis
Removes and returns the last item off of a variable containing delimited text

Description
Example:

```
exten => s,1,Set(array=one,two,three)
exten => s,n,While($"${SET(var=${POP(array)})}" != "")
exten => s,n,NoOp(var is ${var})
exten => s,n,EndWhile
```

This would iterate over each value in array, right to left, and would result in NoOp(var is three), NoOp(var is two), and NoOp(var is one) being executed.

Syntax

```
POP(varname[,delimiter])
```

Arguments

- `varname`
- `delimiter`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_PP_EACH_EXTENSION

PP_EACH_EXTENSION()

Synopsis

Execute specified template for each extension.

Description

Output the specified template for each extension associated with the specified MAC address.

Syntax

```
PP_EACH_EXTENSION(mac,template_file)
```

Arguments

- `mac`
- `template_file`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_PP_EACH_USER

PP_EACH_USER()

Synopsis
Generate a string for each phoneprov user.

Description
Pass in a string, with phoneprov variables you want substituted in the format of %{VARNAME}, and you will get the string rendered for each user in phoneprov excluding ones with MAC address exclude_mac. Probably not useful outside of res_phoneprov.

Example: ${PP_EACH_USER(<item><fn>%{DISPLAY_NAME}</fn></item>|${MAC})

Syntax

```plaintext
PP_EACH_USER(string,exclude_mac)
```

Arguments

- string
- exclude_mac

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_PRESENCE_STATE

PRESENCE_STATE()

Synopsis
Get or Set a presence state.

Description
The PRESENCE_STATE function can be used to retrieve the presence from any presence provider. For example:

NoOp(SIP/mypeer has presence ${PRESENCE_STATE(SIP/mypeer,value)})

NoOp(Conference number 1234 has presence message ${PRESENCE_STATE(MeetMe:1234,message)})

The PRESENCE_STATE function can also be used to set custom presence state from the dialplan. The CustomPresence prefix must be used. For example:

Set(PRESENCE_STATE(CustomPresence:lamp1)=away,temporary,Out to lunch)
Set(PRESENCE_STATE(CustomPresence:lamp2)=dnd,,Trying to get work done)
Set(PRESENCE_STATE(CustomPresence:lamp3)=xa,T24gdmFjYXRpb24=,,e)
Set(BASE64_LAMP3_PRESENCE=${PRESENCE_STATE(CustomPresence:lamp3,subtype,e)})

You can subscribe to the status of a custom presence state using a hint in the dialplan:

exten => 1234,hint,,CustomPresence:lamp1

The possible values for both uses of this function are:
not_set | unavailable | available | away | xa | chat | dnd

Syntax

PRESENCE_STATE(provider,field[,options])

Arguments

- provider - The provider of the presence, such as CustomPresence
- field - Which field of the presence state information is wanted.
  - value - The current presence, such as away
  - subtype - Further information about the current presence
  - message - A custom message that may indicate further details about the presence
- options
  - e - On Write - Use this option when the subtype and message provided are Base64 encoded. The values will be stored encoded within Asterisk, but all consumers of the presence state (e.g. the SIP presence event package) will receive decoded values. On Read - Retrieves unencoded message/subtype in Base64 encoded form.

Asterisk 14 Function_PUSH

PUSH()

Synopsis

Appends one or more values to the end of a variable containing delimited text

Description

Example: Set(PUSH(array)=one,two,three) would append one, two, and three to the end of the values stored in the variable "array".

Syntax

```
PUSH(varname[,delimiter])
```

Arguments

- varname
- delimiter

Asterisk 14 Function_QUEUE_GET_CHANNEL

QUEUE_GET_CHANNEL()

Synopsis
Return caller at the specified position in a queue.

Description
Returns the caller channel at position in the specified queue.
If position is unspecified the first channel is returned.

Syntax

```
QUEUE_GET_CHANNEL(queuename,position)
```

Arguments

- queuename
- position

See Also

Asterisk 14 Function QUEUE_MEMBER

QUEUE_MEMBER()

Synopsis
Count number of members answering a queue.

Description
Allows access to queue counts [R] and member information [R/W].
queuename is required for all read operations.
interface is required for all member operations.

Syntax

```
QUEUE_MEMBER([queuename,option[,interface]])
```

Arguments

- queuename
- option
  - logged - Returns the number of logged-in members for the specified queue.
  - free - Returns the number of logged-in members for the specified queue that either can take calls or are currently wrapping up after a previous call.
  - ready - Returns the number of logged-in members for the specified queue that are immediately available to answer a call.
  - penalty - Gets or sets queue member penalty. If queuename is not specified when setting the penalty then the penalty is set in all queues the interface is a member.
  - paused - Gets or sets queue member paused status. If queuename is not specified when setting the paused status then the paused status is set in all queues the interface is a member.
  - ringinuse - Gets or sets queue member ringinuse. If queuename is not specified when setting ringinuse then ringinuse is set in all queues the interface is a member.
  - interface

Asterisk 14 Function_QUEUE_VARIABLES

QUEUE_VARIABLES()

Synopsis

Return Queue information in variables.

Description

Makes the following queue variables available.

Returns 0 if queue is found and setqueuevar is defined, -1 otherwise.

Syntax

QUEUE_VARIABLES(queuename)

Arguments

- queuename
  - QUEUEMAX - Maximum number of calls allowed.
  - QUEUESTRATEGY - The strategy of the queue.
  - QUEUECALLS - Number of calls currently in the queue.
  - QUEUERECALLHOLDTIME - Current average hold time.
  - QUEUECOMPLETED - Number of completed calls for the queue.
  - QUEUEABANDONED - Number of abandoned calls.
  - QUEUESRVLEVEL - Queue service level.
  - QUEUE SRVLEVELPERF - Current service level performance.

Asterisk 14 Function QUEUE_WAITING_COUNT

QUEUE_WAITING_COUNT()

Synopsis
Count number of calls currently waiting in a queue.

Description
Returns the number of callers currently waiting in the specified queue.

Syntax

```
QUEUE_WAITING_COUNT(queuename)
```

Arguments

- `queuename`

See Also

- Asterisk 14 Application_QUEUE
- Asterisk 14 Application_QueueLog
- Asterisk 14 Application_AddQueueMember
- Asterisk 14 Application_RemoveQueueMember

Asterisk 14 Function _QUOTE

QUOTE()

Synopsis
Quotes a given string, escaping embedded quotes as necessary

Description
Example: ${QUOTE(ab"c"de)} will return ""ab""c""de""

Syntax

```
QUOTE(string)
```

Arguments

- `string`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function RAND

RAND()

Synopsis

Choose a random number in a range.

Description

Choose a random number between min and max. min defaults to 0, if not specified, while max defaults to RAND_MAX (2147483647 on many systems). Example: Set(junky=${RAND(1,8)}); Sets junky to a random number between 1 and 8, inclusive.

Syntax

```
RAND[min, max]
```

Arguments

- min
- max

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_REALTIME

REALTIME()

Synopsis

RealTime Read/Write Functions.

Description

This function will read or write values from/to a RealTime repository. REALTIME(...) will read names/values from the repository, and REALTIME(...)= will write a new value/field to the repository. On a read, this function returns a delimited text string. The name/value pairs are delimited by delim1, and the name and value are delimited between each other with delim2. If there is no match, NULL will be returned by the function. On a write, this function will always return NULL.

Syntax

```
REALTIME(family,fieldmatch,matchvalue,delim1|field,delim2)
```

Arguments

- family
- fieldmatch
- matchvalue
- delim1|field - Use delim1 with delim2 on read and field without delim2 on write
  - If we are reading and delim1 is not specified, defaults to ,
  - delim2 - Parameter only used when reading, if not specified defaults to =

See Also

- Asterisk 14 Function_REALTIME_DESTROY
- Asterisk 14 Function_REALTIME_FIELD
- Asterisk 14 Function_REALTIME_HASH

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_REALTIME_DESTROY

REALTIME_DESTROY()

Synopsis
RealTime Destroy Function.

Description
This function acts in the same way as REALTIME(....) does, except that it destroys the matched record in the RT engine.

Note
If live_dangerously in asterisk.conf is set to no, this function can only be read from the dialplan, and not directly from external protocols. It can, however, be executed as a write operation {REALTIME_DESTROY{family, fieldmatch}=ignored}

Syntax

REALTIME_DESTROY(family,fieldmatch,matchvalue,delim1,delim2)

Arguments

- family
- fieldmatch
- matchvalue
- delim1
- delim2

See Also

- Asterisk 14 Function_REALTIME
- Asterisk 14 Function_REALTIME_STORE
- Asterisk 14 Function_REALTIME_FIELD
- Asterisk 14 Function_REALTIME_HASH

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_REALTIME_FIELD

REALTIME_FIELD()

Synopsis

RealTime query function.

Description

This function retrieves a single item, fieldname from the RT engine, where fieldmatch contains the value matchvalue. When written to, the REALTIME_FIELD() function performs identically to the REALTIME() function.

Syntax

REALTIME_FIELD(family,fieldmatch,matchvalue,fieldname)

Arguments

- family
- fieldmatch
- matchvalue
- fieldname

See Also

- Asterisk 14 Function_REALTIME
- Asterisk 14 Function_REALTIME_STORE
- Asterisk 14 Function_REALTIME.Destroy
- Asterisk 14 Function_REALTIME_HASH

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_REALTIME_HASH

REALTIME_HASH()

Synopsis

RealTime query function.

Description

This function retrieves a single record from the RT engine, where fieldmatch contains the value matchvalue and formats the output suitably, such that it can be assigned to the HASH() function. The HASH() function then provides a suitable method for retrieving each field value of the record.

Syntax

```
REALTIME_HASH(family,fieldmatch,matchvalue)
```

Arguments

- family
- fieldmatch
- matchvalue

See Also

- Asterisk 14 Function_REALTIME
- Asterisk 14 Function_REALTIME_STORE
- Asterisk 14 Function_REALTIME_DESTROY
- Asterisk 14 Function_REALTIME_FIELD

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_REALTIME_STORE

REALTIME_STORE()

Synopsis
RealTime Store Function.

Description
This function will insert a new set of values into the RealTime repository. If RT engine provides an unique ID of the stored record, REALTIME_STORE(...) creates channel variable named RTSTOREID, which contains value of unique ID. Currently, a maximum of 30 field/value pairs is supported.

Syntax

```
REALTIME_STORE(family,field1,fieldN,...,field30)
```

Arguments

- **family**
- **field1**
- **fieldN**
- **field30**

See Also

- Asterisk 14 Function_REALTIME_DESTROY
- Asterisk 14 Function_REALTIME_FIELD
- Asterisk 14 Function_REALTIME_HASH

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function REDIRECTING

REDIRECTING()

Synopsis

Gets or sets Redirecting data on the channel.

Description

Gets or sets Redirecting data on the channel.

The orig-pres, from-pres and to-pres fields get/set a combined value for the corresponding ...-name-pres and ...-num-pres fields.

The recognized values for the reason and orig-reason fields are the following:

- away - Callee is Away
- cf_dte - Call Forwarding By The Called DTE
- cfb - Call Forwarding Busy
- cfnr - Call Forwarding No Reply
- cfu - Call Forwarding Unconditional
- deflection - Call Deflection
- dnd - Do Not Disturb
- follow_me - Follow Me
- out_of_order - Called DTE Out-Of-Order
- send_to_vm - Send the call to voicemail
- time_of_day - Time of Day
- unavailable - Callee is Unavailable
- unknown - Unknown

Note

You can set a user defined reason string that SIP can send/receive instead. The user defined reason string may need to be quoted depending upon SIP or the peer's requirements. These strings are treated as unknown by the non-SIP channel drivers.

The allowable values for the xxx-name-charset field are the following:

- unknown - Unknown
- iso8859-1 - ISO8859-1
- withdrawn - Withdrawn
- iso8859-2 - ISO8859-2
- iso8859-3 - ISO8859-3
- iso8859-4 - ISO8859-4
- iso8859-5 - ISO8859-5
- iso8859-7 - ISO8859-7
- bmp - ISO10646 Bmp String
- utf8 - ISO10646 UTF-8 String

Syntax

REDIRECTING(datatype,i)

Arguments

- datatype - The allowable datatypes are:
  - orig-all
  - orig-name
  - orig-name-valid
  - orig-name-charset
  - orig-name-pres
  - orig-num
  - orig-num-valid
  - orig-num-plan
  - orig-num-pres
  - orig-pres
  - orig-subaddr
  - orig-subaddr-valid
  - orig-subaddr-type
  - orig-subaddr-odd
- `priv-to-subaddr-odd`
- `priv-to-tag`
- `reason`
- `count`

- If set, this will prevent the channel from sending out protocol messages because of the value being set

See Also

Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Function_REGEX

REGEX()

Synopsis

Check string against a regular expression.

Description

Return 1 on regular expression match or 0 otherwise

Please note that the space following the double quotes separating the regex from the data is optional and if present, is skipped. If a space is desired at the beginning of the data, then put two spaces there; the second will not be skipped.

Syntax

```
REGEX("regular expression" string)
```

Arguments

- "regular expression"
- string

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_REPLACE

REPLACE()

Synopsis

Replace a set of characters in a given string with another character.

Description

Iterates through a string replacing all the find-chars with replace-char. replace-char may be either empty or contain one character. If empty, all find-chars will be deleted from the output.

Note

The replacement only occurs in the output. The original variable is not altered.

Syntax

REPLACE(varname, find-chars[, replace-char])

Arguments

- varname
- find-chars
- replace-char

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SET

SET()

Synopsis
SET assigns a value to a channel variable.

Description

Syntax

```
SET(varname=value)
```

Arguments

- `varname`
- `value`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SHA1

SHA1()

Synopsis

Computes a SHA1 digest.

Description

Generate a SHA1 digest via the SHA1 algorithm.

Example: Set(sha1hash=${SHA1(junky)})

Sets the asterisk variable sha1hash to the string 60fa5675b9303eb62f99a9cd47f9f5837d18f9a0, which is known as its hash

Syntax

SHA1(data)

Arguments

- **data** - Input string

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SHARED

SHARED()

Synopsis

Gets or sets the shared variable specified.

Description

Implements a shared variable area, in which you may share variables between channels.

The variables used in this space are separate from the general namespace of the channel and thus \texttt{SHARED(foo)} and \texttt{foo} represent two completely different variables, despite sharing the same name.

Finally, realize that there is an inherent race between channels operating at the same time, fiddling with each others' internal variables, which is why this special variable namespace exists; it is to remind you that variables in the \texttt{SHARED} namespace may change at any time, without warning. You should therefore take special care to ensure that when using the \texttt{SHARED} namespace, you retrieve the variable and store it in a regular channel variable before using it in a set of calculations (or you might be surprised by the result).

Syntax

\texttt{SHARED(varname,channel)}

Arguments

- \texttt{varname} - Variable name
- \texttt{channel} - If not specified will default to current channel. It is the complete channel name: \texttt{SIP/12-abcd1234} or the prefix only \texttt{SIP/12}.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SHELL

SHELL()

Synopsis

Executes a command using the system shell and captures its output.

Description

Collects the output generated by a command executed by the system shell

Example: Set (foo=${SHELL(echo bar)})

Syntax

SHELL(command)

Arguments

- command - The command that the shell should execute.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function SHIFT

SHIFT()

Synopsis

Removes and returns the first item off of a variable containing delimited text

Description

Example:

exten => s,1,Set(array=one,two,three)

d2 => s,1,While($"[${SET(var=${SHIFT(array)})}"
!= ")

exten => s,n,NoOp(var is ${var})

This would iterate over each value in array, left to right, and would result in NoOp(var is one), NoOp(var is two), and NoOp(var is three) being executed.

Syntax

```
SHIFT(varname[,delimiter])
```

Arguments

- `varname`
- `delimiter`

See Also

Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Function_SIP_HEADER

SIP_HEADER()

Synopsis

Gets the specified SIP header from an incoming INVITE message.

Description

Since there are several headers (such as Via) which can occur multiple times, SIP_HEADER takes an optional second argument to specify which header with that name to retrieve. Headers start at offset 1.

Please observe that contents of the SDP (an attachment to the SIP request) can't be accessed with this function.

Syntax

\[
\text{SIP\_HEADER(name,\ number)}
\]

Arguments

- \text{name}
- \text{number} - If not specified, defaults to 1.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SIPPEER

SIPPEER()

Synopsis

Gets SIP peer information.

Description

Syntax

SIPPEER(peername,item)

Arguments

- peername
- item
  - ip - (default) The IP address.
  - port - The port number.
  - mailbox - The configured mailbox.
  - context - The configured context.
  - expire - The epoch time of the next expire.
  - dynamic - Is it dynamic? (yes/no).
  - callerid_name - The configured Caller ID name.
  - callerid_num - The configured Caller ID number.
  - callgroup - The configured Callgroup.
  - pickupgroup - The configured Pickupgroup.
  - namedcallgroup - The configured Named Callgroup.
  - namedpickupgroup - The configured Named Pickupgroup.
  - codecs - The configured codecs.
  - status - Status (if qualify=yes).
  - regexten - Extension activated at registration.
  - limit - Call limit (call-limit).
  - busylevel - Configured call level for signalling busy.
  - curcalls - Current amount of calls. Only available if call-limit is set.
  - language - Default language for peer.
  - accountcode - Account code for this peer.
  - useragent - Current user agent header used by peer.
  - maxforwards - The value used for SIP loop prevention in outbound requests
  - chanvarname - A channel variable configured with setvar for this peer.
  - codec - Preferred codec index number x (beginning with zero).

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SMDI_MSG

SMDI_MSG()

Synopsis
Retrieve details about an SMDI message.

Description
This function is used to access details of an SMDI message that was pulled from the incoming SMDI message queue using the SMDI_MSG_RETRIEVE() function.

Syntax

SMDI_MSG(message_id, component)

Arguments
- message_id
- component - Valid message components are:
  - number - The message desk number
  - terminal - The message desk terminal
  - station - The forwarding station
  - callerid - The callerID of the calling party that was forwarded
  - type - The call type. The value here is the exact character that came in on the SMDI link. Typically, example values are:
    Options:
    - D - Direct Calls
    - A - Forward All Calls
    - B - Forward Busy Calls
    - N - Forward No Answer Calls

See Also
- Asterisk 14 Function_SMDI_MSG_RETRIEVE

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SMDI_MSG RETRIEVE

SMDI_MSG RETRIEVE()

Synopsis
Retrieve an SMDI message.

Description
This function is used to retrieve an incoming SMDI message. It returns an ID which can be used with the SMDI_MSG() function to access details of the message. Note that this is a destructive function in the sense that once an SMDI message is retrieved using this function, it is no longer in the global SMDI message queue, and can not be accessed by any other Asterisk channels. The timeout for this function is optional, and the default is 3 seconds. When providing a timeout, it should be in milliseconds.

The default search is done on the forwarding station ID. However, if you set one of the search key options in the options field, you can change this behavior.

Syntax

```
SMDI_MSG RETRIEVE(smdi port, search key, timeout, options)
```

Arguments
- smdi port
- search key
- timeout
- options
  - t - Instead of searching on the forwarding station, search on the message desk terminal.
  - n - Instead of searching on the forwarding station, search on the message desk number.

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SORT

SORT()

Synopsis
Sorts a list of key/vals into a list of keys, based upon the vals.

Description
Takes a comma-separated list of keys and values, each separated by a colon, and returns a comma-separated list of the keys, sorted by their values. Values will be evaluated as floating-point numbers.

Syntax

```
SORT(keyval,keyvaln[,...])
```

Arguments

- `keyval`
  - `key1`
  - `val1`
- `keyvaln`
  - `key2`
  - `val2`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SPEECH

SPEECH()

Synopsis
Gets information about speech recognition results.

Description
Gets information about speech recognition results.

Syntax

```
SPEECH(argument)
```

Arguments

- **argument**
  - **status** - Returns 1 upon speech object existing, or 0 if not
  - **spoke** - Returns 1 if spoker spoke, or 0 if not
  - **results** - Returns number of results that were recognized.

See Also

Import Version

Asterisk 14 Function_SPEECH_ENGINE

SPEECH_ENGINE()

Synopsis
Get or change a speech engine specific attribute.

Description
Changes a speech engine specific attribute.

Syntax

SPEECH_ENGINE(name)

Arguments

- name

See Also

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SPEECH_GRAMMAR

SPEECH_GRAMMAR()

Synopsis

Gets the matched grammar of a result if available.

Description

Gets the matched grammar of a result if available.

Syntax

```
SPEECH_GRAMMAR(nbest_number/result_number)
```

Arguments

- nbest_number
- result_number

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SPEECH_RESULTS_TYPE

SPEECH_RESULTS_TYPE()

Synopsis
Sets the type of results that will be returned.

Description
Sets the type of results that will be returned. Valid options are normal or nbest.

Syntax

```
SPEECH_RESULTS_TYPE()
```

Arguments

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SPEECH_SCORE

SPEECH_SCORE()

Synopsis

Gets the confidence score of a result.

Description

Gets the confidence score of a result.

Syntax

SPEECH_SCORE(nbest_number/result_number)

Arguments

- nbest_number
- result_number

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SPEECH_TEXT

SPEECH_TEXT()

Synopsis
Gets the recognized text of a result.

Description
Gets the recognized text of a result.

Syntax

SPEECH_TEXT(nbest_number/result_number)

Arguments

- nbest_number
- result_number

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SPRINTF

SPRINTF()

Synopsis
Format a variable according to a format string.

Description
Parses the format string specified and returns a string matching that format. Supports most options found in sprintf(3). Returns a shortened string if a format specifier is not recognized.

Syntax
SPRINTF[format],[arg1],[arg2],...,argN]

Arguments

- format
- arg1
- arg2
- argN

See Also

- sprintf(3)

Import Version
This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SQL_ESC

SQL_ESC()

Synopsis
Escapes single ticks for use in SQL statements.

Description
Used in SQL templates to escape data which may contain single ticks ' which are otherwise used to delimit data.

Example: SELECT foo FROM bar WHERE baz='${SQL_ESC(${ARG1})}'

Syntax

```
SQL_ESC(string)
```

Arguments

- string

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SRVQUERY

SRVQUERY()

Synopsis
Initiate an SRV query.

Description
This will do an SRV lookup of the given service.

Syntax

```
SRVQUERY(service)
```

Arguments

- **service** - The service for which to look up SRV records. An example would be something like `_sip._udp.example.com`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_SRVRESULT

SRVRESULT()

Synopsis
Retrieve results from an SRVQUERY.

Description
This function will retrieve results from a previous use of the SRVQUERY function.

Syntax

```
SRVRESULT(id,resultnum)
```

Arguments

- **id** - The identifier returned by the SRVQUERY function.
- **resultnum** - The number of the result that you want to retrieve.

Results start at 1. If this argument is specified as `getnum`, then it will return the total number of results that are available.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_STACK_PEEK

STACK_PEEK()

Synopsis

View info about the location which called Gosub

Description

Read the calling {{context}}, {{extension}}, {{priority}}, or {{label}}, as specified by which, by going up n frames in the Gosub stack. If suppress is true, then if the number of available stack frames is exceeded, then no error message will be printed.

Syntax

```
STACK_PEEK(n,which[,suppress])
```

Arguments

- n
- which
- suppress

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_STAT

STAT()

Synopsis

Does a check on the specified file.

Description

**Note**

If `live_dangerously` in `asterisk.conf` is set to `no`, this function can only be executed from the dialplan, and not directly from external protocols.

Syntax

```
STAT(flag, filename)
```

Arguments

- **flag** - Flag may be one of the following:
  - d - Checks if the file is a directory.
  - e - Checks if the file exists.
  - f - Checks if the file is a regular file.
  - m - Returns the file mode (in octal)
  - s - Returns the size (in bytes) of the file
  - A - Returns the epoch at which the file was last accessed.
  - C - Returns the epoch at which the inode was last changed.
  - M - Returns the epoch at which the file was last modified.
- **filename**

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_STRFTIME

STRFTIME()

Synopsis

Returns the current date/time in the specified format.

Description

STRFTIME supports all of the same formats as the underlying C function strftime(3). It also supports the following format: \%[n]q - fractions of a second, with leading zeros.

Example: %3q will give milliseconds and %1q will give tenths of a second. The default is set at milliseconds (n=3). The common case is to use it in combination with %S, as in %S.%3q.

Syntax

STRFTIME(epoch,timezone,format)

Arguments

- epoch
- timezone
- format

See Also

- strftime(3)

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_STRPTIME

STRPTIME()

Synopsis

Returns the epoch of the arbitrary date/time string structured as described by the format.

Description

This is useful for converting a date into EPOCH time, possibly to pass to an application like SayUnixTime or to calculate the difference between the two date strings

Example: ${STRPTIME(2006-03-01 07:30:35,America/Chicago,%Y-%m-%d %H:%M:%S)} returns 1141219835

Syntax

STRPTIME(datetime,timezone,format)

Arguments

- datetime
- timezone
- format

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_STRREPLACE

STRREPLACE()

Synopsis

Replace instances of a substring within a string with another string.

Description

Searches for all instances of the find-string in provided variable and replaces them with replace-string. If replace-string is an empty string, this will effectively delete that substring. If max-replacements is specified, this function will stop after performing replacements max-replacements times.

Note

The replacement only occurs in the output. The original variable is not altered.

Syntax

```
STRREPLACE(varname,find-string[,replace-string[,max-replacements]]);
```

Arguments

- varname
- find-string
- replace-string
- max-replacements

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164.
Asterisk 14 Function_SYSINFO

SYSINFO()

Synopsis

Returns system information specified by parameter.

Description

Returns information from a given parameter.

Syntax

```
SYSINFO(parameter)
```

Arguments

- **parameter**
  - `loadavg` - System load average from past minute.
  - `numcalls` - Number of active calls currently in progress.
  - `uptime` - System uptime in hours.
  - `totalram` - Total usable main memory size in KiB.
  - `freeram` - Available memory size in KiB.
  - `bufferram` - Memory used by buffers in KiB.
  - `totalswap` - Total swap space still available in KiB.
  - `freeswap` - Free swap space still available in KiB.
  - `numprocs` - Number of current processes.

Note

This parameter is dependant upon operating system.

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_TALK_DETECT

TALK_DETECT()

Synopsis

Raises notifications when Asterisk detects silence or talking on a channel.

Description

The TALK_DETECT function enables events on the channel it is applied to. These events can be emitted over AMI, ARI, and potentially other Asterisk modules that listen for the internal notification.

The function has two parameters that can optionally be passed when set on a channel: dsp_talking_threshold and dsp_silence_threshold.

dsp_talking_threshold is the time in milliseconds of sound above what the dsp has established as base line silence for a user before a user is considered to be talking. By default, the value of silencethreshold from dsp.conf is used. If this value is set too tight events may be falsely triggered by variants in room noise.

Valid values are 1 through 2^31.

dsp_silence_threshold is the time in milliseconds of sound falling within what the dsp has established as baseline silence before a user is considered be silent. If this value is set too low events indicating the user has stopped talking may get falsely sent out when the user briefly pauses during mid sentence.

The best way to approach this option is to set it slightly above the maximum amount of ms of silence a user may generate during natural speech.

By default this value is 2500ms. Valid values are 1 through 2^31.

Example:

same => n,Set(TALK_DETECT(set)={}) ; Enable talk detection
same => n,Set(TALK_DETECT(set)=1200) ; Update existing talk detection's silence threshold to 1200 ms
same => n,Set(TALK_DETECT(remove)={}) ; Remove talk detection
same => n,Set(TALK_DETECT(set)={},128) ; Enable and set talk threshold to 128

This function will set the following variables:

### Syntax

TALK_DETECT(action)

### Arguments

- **action**
  - **remove** · W/O. Remove talk detection from the channel.
  - **set** · W/O. Enable TALK_DETECT and/or configure talk detection parameters. Can be called multiple times to change parameters on a channel with talk detection already enabled.
    - **dsp_silence_threshold** · The time in milliseconds before which a user is considered silent.
    - **dsp_talking_threshold** · The time in milliseconds after which a user is considered talking.

### Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Function_TESTTIME

TESTTIME()

Synopsis

Sets a time to be used with the channel to test logical conditions.

Description

To test dialplan timing conditions at times other than the current time, use this function to set an alternate date and time. For example, you may wish to evaluate whether a location will correctly identify to callers that the area is closed on Christmas Day, when Christmas would otherwise fall on a day when the office is normally open.

Syntax

```
TESTTIME(date, time[, zone])
```

Arguments

- **date**: Date in ISO 8601 format
- **time**: Time in HH:MM:SS format (24-hour time)
- **zone**: Timezone name

See Also

- Asterisk 14 Application_GotoIfTime

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_TIMEOUT

TIMEOUT()

Synopsis

Gets or sets timeouts on the channel. Timeout values are in seconds.

Description

The timeouts that can be manipulated are:

absolute: The absolute maximum amount of time permitted for a call. Setting of 0 disables the timeout.

digit: The maximum amount of time permitted between digits when the user is typing in an extension. When this timeout expires, after the user has started to type in an extension, the extension will be considered complete, and will be interpreted. Note that if an extension typed in is valid, it will not have to timeout to be tested, so typically at the expiry of this timeout, the extension will be considered invalid (and thus control would be passed to the i extension, or if it doesn't exist the call would be terminated). The default timeout is 5 seconds.

response: The maximum amount of time permitted after falling through a series of priorities for a channel in which the user may begin typing an extension. If the user does not type an extension in this amount of time, control will pass to the t extension if it exists, and if not the call would be terminated. The default timeout is 10 seconds.

Syntax

```
TIMEOUT(timeouttype)
```

Arguments

- timeouttype - The timeout that will be manipulated. The possible timeout types are: absolute, digit or response

Asterisk 14 Function_TOLOWER

TOLOWER()

Synopsis
Convert string to all lowercase letters.

Description
Example: ${TOLOWER(Example)} returns "example"

Syntax

```
TOLOWER(string)
```

Arguments

- `string`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_TOUPPER

TOUPPER()

Synopsis

Convert string to all uppercase letters.

Description

Example: `${TOUPPER(Example)}` returns "EXAMPLE"

Syntax

```
TOUPPER(string)
```

Arguments

- `string`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_TRYLOCK

TRYLOCK()

Synopsis

Attempt to obtain a named mutex.

Description

Attempts to grab a named lock exclusively, and prevents other channels from obtaining the same lock. Returns 1 if the lock was available or 0 otherwise.

Note

If live_dangerously in asterisk.conf is set to no, this function can only be executed from the dialplan, and not directly from external protocols.

Syntax

```
TRYLOCK(lockname)
```

Arguments

- `lockname`

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_TXTCIDNAME

TXTCIDNAME()

Synopsis

TXTCIDNAME looks up a caller name via DNS.

Description

This function looks up the given phone number in DNS to retrieve the caller id name. The result will either be blank or be the value found in the TXT record in DNS.

Syntax

TXTCIDNAME(number,zone-suffix)

Arguments

- number
- zone-suffix - If no zone-suffix is given, the default will be e164.arpa

See Also

Import Version

This documentation was imported from Asterisk Version Git-master-7d17164
Asterisk 14 Function_UNLOCK

UNLOCK()

Synopsis

Unlocks a named mutex.

Description

Unlocks a previously locked mutex. Returns 1 if the channel had a lock or 0 otherwise.

Note

It is generally unnecessary to unlock in a hangup routine, as any locks held are automatically freed when the channel is destroyed.

Note

If live_dangerously in asterisk.conf is set to no, this function can only be executed from the dialplan, and not directly from external protocols.

Syntax

UNLOCK(lockname)

Arguments

- lockname

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_UNSHIFT

UNSHIFT()

Synopsis

Inserts one or more values to the beginning of a variable containing delimited text

Description

Example: Set(UNSHIFT(array)=one,two,three) would insert one, two, and three before the values stored in the variable "array".

Syntax

UNSHIFT(varname[,delimiter])

Arguments

- varname
- delimiter

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function URIDECODE

URIDECODE()

Synopsis
Decodes a URI-encoded string according to RFC 2396.

Description
Returns the decoded URI-encoded data string.

Syntax

```
URIDECODE(data)
```

Arguments

- `data` - Input string to be decoded.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_URIENCODE

URIENCODE()

Synopsis

Encodes a string to URI-safe encoding according to RFC 2396.

Description

Returns the encoded string defined in data.

Syntax

URIENCODE(data)

Arguments

- data - Input string to be encoded.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function VALID_EXTEN

VALID_EXTEN()

Synopsis
Determine whether an extension exists or not.

Description
Returns a true value if the indicated context, extension, and priority exist.

Warning
This function has been deprecated in favor of the DIALPLAN_EXISTS() function

Syntax

```
VALID_EXTEN(context,extension,priority)
```

Arguments

- context - Defaults to the current context
- extension
- priority - Priority defaults to 1.

See Also

Import Version

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Function_VERSION

VERSION()

Synopsis

Return the Version info for this Asterisk.

Description

If there are no arguments, return the version of Asterisk in this format: SVN-branch-1.4-r44830M

Example: Set(junky=${VERSION()};

Sets junky to the string SVN-branch-1.6-r74830M, or possibly, SVN-trunk-r45126M.

Syntax

```
VERSION(info)
```

Arguments

- **info** - The possible values are:
  - **ASTERISK_VERSION_NUM** - A string of digits is returned, e.g. 10602 for 1.6.2 or 100300 for 10.3.0, or 999999 when using an SVN build.
  - **BUILD_USER** - The string representing the user's name whose account was used to configure Asterisk, is returned.
  - **BUILD_HOSTNAME** - The string representing the name of the host on which Asterisk was configured, is returned.
  - **BUILD_MACHINE** - The string representing the type of machine on which Asterisk was configured, is returned.
  - **BUILD_OS** - The string representing the OS of the machine on which Asterisk was configured, is returned.
  - **BUILD_DATE** - The string representing the date on which Asterisk was configured, is returned.
  - **BUILD_KERNEL** - The string representing the kernel version of the machine on which Asterisk was configured, is returned.

Asterisk 14 Function_VM_INFO

VM_INFO()

Synopsis

Returns the selected attribute from a mailbox.

Description

Returns the selected attribute from the specified mailbox. If context is not specified, defaults to the default context. Where the folder can be specified, common folders include INBOX, Old, Work, Family and Friends.

Syntax

```plaintext
VM_INFO(mailbox,attribute[,folder])
```

Arguments

- mailbox
  - mailbox
  - context
- attribute
  - count: Count of messages in specified folder. If folder is not specified, defaults to INBOX.
  - email: E-mail address associated with the mailbox.
  - exists: Returns a boolean of whether the corresponding mailbox exists.
  - fullname: Full name associated with the mailbox.
  - language: Mailbox language if overridden, otherwise the language of the channel.
  - locale: Mailbox locale if overridden, otherwise global locale.
  - pager: Pager e-mail address associated with the mailbox.
  - password: Mailbox access password.
  - tz: Mailbox timezone if overridden, otherwise global timezone
- folder: If not specified, INBOX is assumed.

Asterisk 14 Function_VMCOUNT

VMCOUNT()

Synopsis
Count the voicemails in a specified mailbox.

Description
Count the number of voicemails in a specified mailbox, you could also specify the mailbox folder.

Example: exten => s,1,Set(froo=${VMCOUNT(125@default)})

Syntax
```
VMCOUNT(vmbox[,folder])
```

Arguments
- vmbox
- folder - If not specified, defaults to INBOX

Asterisk 14 Function_VOLUIME

VOLUME()

Synopsis
Set the TX or RX volume of a channel.

Description
The VOLUME function can be used to increase or decrease the tx or rx gain of any channel.

For example:
Set(VOLUME(TX)=3)
Set(VOLUME(RX)=2)
Set(VOLUME(TX,p)=3)
Set(VOLUME(RX,p)=3)

Syntax
VOLUME(direction,options)

Arguments
- direction - Must be TX or RX.
- options
  - p - Enable DTMF volume control

</tbody>
</table>

Configuration Option Descriptions

ackcall

Enable to require the agent to give a DTMF acknowledgement when the agent receives a call.

Note
The option is overridden by AGENTACKCALL on agent login.

Note
Option changes take effect on agent login or after an agent disconnects from a call.

acceptdtmf

Note
The option is overridden by AGENTACCEPTDTMF on agent login.

Note
Option changes take effect on agent login or after an agent disconnects from a call.
autologoff

Set how many seconds a call for the agent has to wait for the agent to acknowledge the call before the agent is automatically logged off. If set to zero then the call will wait forever for the agent to acknowledge.

Note
The option is overridden by AGENTAUTOLOGOFF on agent login.

Note
The option is ignored unless the ackcall option is enabled.

Note
Option changes take effect on agent login or after an agent disconnects from a call.

wrapuptime

Set the minimum amount of time in milliseconds after disconnecting a call before the agent can receive a new call.

Note
The option is overridden by AGENTWRAPUPTIME on agent login.

Note
Option changes take effect on agent login or after an agent disconnects from a call.

musiconhold

Note
Option changes take effect on agent login or after an agent disconnects from a call.

recordagentcalls

Enable recording calls the agent takes automatically by invoking the automixmon DTMF feature when the agent connects to a caller. See features.conf.sample for information about the automixmon feature.

Note
Option changes take effect on agent login or after an agent disconnects from a call.

custom_beep

Note
Option changes take effect on agent login or after an agent disconnects from a call.

fullname

Note
Option changes take effect on agent login or after an agent disconnects from a call.

</tr>
</tbody>
</table>
When using the CONFBRIDGE dialplan function, use a user profile as a template for creating a new temporary profile.

**Configuration Option Descriptions**

**type**

The type parameter determines how a context in the configuration file is interpreted.

- **user** - Configure the context as a user_profile
- **bridge** - Configure the context as a bridge_profile
- **menu** - Configure the context as a menu

**announce_user_count_all**

Sets if the number of users should be announced to all the other users in the conference when this user joins. This option can be either set to 'yes' or a number. When set to a number, the announcement will only occur once the user count is above the specified number.

**denoise**

Sets whether or not a denoise filter should be applied to the audio before mixing or not. Off by default. Requires codec_speex to be built and installed. Do not confuse this option with drop_silence. Denoise is useful if there is a lot of background noise for a user as it attempts to remove the noise while preserving the speech. This option does NOT remove silence from being mixed into the conference and does come at the cost of a slight performance hit.

**dsp_drop_silence**

This option drops what Asterisk detects as silence from entering into the bridge. Enabling this option will drastically improve performance and help remove the buildup of background noise from the conference. Highly recommended for large conferences due to its performance enhancements.

**dsp_silence_threshold**

The time in milliseconds of sound falling within the what the dsp has established as baseline silence before a user is considered be silent. This value affects several operations and should not be changed unless the impact on call quality is fully understood.

What this value affects internally:

1. When talk detection AMI events are enabled, this value determines when the user has stopped talking after a period of talking. If this value is set too low AMI events indicating the user has stopped talking may get falsely sent out when the user briefly pauses during mid sentence.

2. The drop_silence option depends on this value to determine when the user's audio should begin to be dropped from the conference bridge after the user stops talking. If this value is set too low the user's audio stream may sound choppy to the other participants. This is caused by the user transitioning constantly from silence to talking during mid sentence.

The best way to approach this option is to set it slightly above the maximum amount of ms of silence a user may generate during natural speech.

By default this value is 2500ms. Valid values are 1 through 2^31.

**dsp_talking_threshold**

The time in milliseconds of sound above what the dsp has established as base line silence for a user before a user is considered to be talking. This value affects several operations and should not be changed unless the impact on call quality is fully understood.

What this value affects internally:

1. Audio is only mixed out of a user's incoming audio stream if talking is detected. If this value is set too loose the user will hear themselves briefly each time they begin talking until the dsp has time to establish that they are in fact talking.

2. When talk detection AMI events are enabled, this value determines when talking has begun which results in an AMI event to fire. If this value is set too tight AMI events may be falsely triggered by variants in room noise.

3. The drop_silence option depends on this value to determine when the user's audio should be mixed into the bridge after periods of silence. If this value is too loose the beginning of a user's speech will get cut off as they transition from silence to talking.

By default this value is 160 ms. Valid values are 1 through 2^31.

**jitterbuffer**
Enabling this option places a jitterbuffer on the user's audio stream before audio mixing is performed. This is highly recommended but will add a slight delay to the audio. This option is using the JITTERBUFFER dialplan function's default adaptive jitterbuffer. For a more fine tuned jitterbuffer, disable this option and use the JITTERBUFFER dialplan function on the user before entering the ConfBridge application.

**bridge_profile**

A named profile to apply to specific bridges.

</tbody>
</table>

### Configuration Option Descriptions

**type**

The type parameter determines how a context in the configuration file is interpreted.

- **user** - Configure the context as a *user_profile*
- **bridge** - Configure the context as a *bridge_profile*
- **menu** - Configure the context as a *menu*

**internal_sample_rate**

Sets the internal native sample rate the conference is mixed at. This is set to automatically adjust the sample rate to the best quality by default. Other values can be anything from 8000-192000. If a sample rate is set that Asterisk does not support, the closest sample rate Asterisk does support to the one requested will be used.
language

By default, announcements to a conference use English. Which means the prompts played to all users within the conference will be English. By changing the language of a bridge, this will change the language of the prompts played to all users.

mixing_interval

Sets the internal mixing interval in milliseconds for the bridge. This number reflects how tight or loose the mixing will be for the conference. In order to improve performance a larger mixing interval such as 40ms may be chosen. Using a larger mixing interval comes at the cost of introducing larger amounts of delay into the bridge. Valid values here are 10, 20, 40, or 80.

record_conference

Records the conference call starting when the first user enters the room, and ending when the last user exits the room. The default recorded filename is ‘confbridge-${name of conference bridge}-${start time}.wav’ and the default format is 8khz slinear. This file will be located in the configured monitoring directory in asterisk.conf.

record_file

When record_conference is set to yes, the specific name of the record file can be set using this option. Note that since multiple conferences may use the same bridge profile, this may cause issues depending on the configuration. It is recommended to only use this option dynamically with the CONFBRIDGE() dialplan function. This allows the record name to be specified and a unique name to be chosen. By default, the record_file is stored in Asterisk's spool/monitor directory with a unique filename starting with the 'confbridge' prefix.

record_file_append

When record_file_append is set to yes, stopping and starting recording on a conference adds the new portion to end of current record_file. When this is set to no, a new record_file is generated every time you start then stop recording on a conference.

record_file_timestamp

When record_file_timestamp is set to yes, the start time is appended to record_file so that the filename is unique. This allows you to specify a record_file but not overwrite existing recordings.

record_options

Pass additional options to MixMonitor when record_conference is set to yes. See MixMonitor for available options.

record_command

Executes the specified command when recording ends. Any strings matching ^{X} will be unescaped to X. All variables will be evaluated at the time ConfBridge is called.

regcontext

When set this will cause the name of the created conference to be registered into the named context at priority 1 with an operation of NoOP(). This can then be used in other parts of the dialplan to test for the existence of a specific conference bridge. You should be aware that there are potential races between testing for the existence of a bridge, and taking action upon that information, consider for example two callers executing the check simultaneously, and then taking special action as "first caller" into the bridge. The same for exiting, directly after the check the bridge can be destroyed before the new caller enters (creating a new bridge), for example, and the "first member" actions could thus be missed.

video_mode

Sets how confbridge handles video distribution to the conference participants. Note that participants wanting to view and be the source of a video feed MUST be sharing the same video codec. Also, using video in conjunction with with the jitterbuffer currently results in the audio being slightly out of sync with the video. This is a result of the jitterbuffer only working on the audio stream. It is recommended to disable the jitterbuffer when video is used.

- none - No video sources are set by default in the conference. It is still possible for a user to be set as a video source via AMI or DTMF action at any time.
- follow_talker - The video feed will follow whoever is talking and providing video.
- last_marked - The last marked user to join the conference with video capabilities will be the single source of video distributed to all participants. If multiple marked users are capable of video, the last one to join is always the source, when that user leaves it goes to the one who joined before them.
- first_marked - The first marked user to join the conference with video capabilities is the single source of video distribution among all participants. If that user leaves, the marked user to join after them becomes the source.
max_members

This option limits the number of participants for a single conference to a specific number. By default conferences have no participant limit. After the limit is reached, the conference will be locked until someone leaves. Note however that an Admin user will always be allowed to join the conference regardless if this limit is reached or not.

sound_

All sounds in the conference are customizable using the bridge profile options below. Simply state the option followed by the filename or full path of the filename after the option. Example: sound_bad Joined=conf-hasjoin This will play the conf-hasjoin sound file found in the sounds directory when announcing someone's name is joining the conference.

- sound_join - The sound played to everyone when someone enters the conference.
- sound_leave - The sound played to everyone when someone leaves the conference.
- sound_has_joined - The sound played before announcing someone's name has joined the conference. This is used for user intros. Example "____ has joined the conference"
- sound_left - The sound played when announcing someone's name has left the conference. This is used for user intros. Example "_____ has left the conference"
- sound_kicked - The sound played to a user who has been kicked from the conference.
- sound_muted - The sound played when the mute option it toggled on.
- sound_unmuted - The sound played when the mute option it toggled off.
- sound_only_person - The sound played when the user is the only person in the conference.
- sound_only_one - The sound played to a user when there is only one other person is in the conference.
- sound_there_are - The sound played when announcing how many users there are in a conference.
- sound_other_in_party - This file is used in conjunction with sound_there_are when announcing how many users there are in the conference. The sounds are stringed together like this. "sound_there_are" ${number of participants} "sound_other_in_party"
- sound_place_into_conference - The sound played when someone is placed into the conference after waiting for a marked user.
- sound_wait_for_leader - The sound played when a user is placed into a conference that can not start until a marked user enters.
- sound_leader_has_left - The sound played when the last marked user leaves the conference.
- sound_get_pin - The sound played when prompting for a conference pin number.
- sound_invalid_pin - The sound played when an invalid pin is entered too many times.
- sound_locked - The sound played when a user trying to join a locked conference.
- sound_locked_now - The sound played to an admin after toggling the conference to locked mode.
- sound_unlocked_now - The sound played to an admin after toggling the conference to unlocked mode.
- sound_error_menu - The sound played when an invalid menu option is entered.

menu

A conference user menu

</tr>
</tbody>
</table>

0-9A-D*#

The ConfBridge application also has the ability to apply custom DTMF menus to each channel using the application. Like the User and Bridge profiles a
menu is passed in to ConfBridge as an argument in the dialplan.

Below is a list of menu actions that can be assigned to a DTMF sequence.

**Note**
To have the first DTMF digit in a sequence be the '#' character, you need to escape it. If it is not escaped then normal config file processing will think it is a directive like #include. For example: The mute setting is toggled when #1 is pressed.

```
#1=toggle_mute
```

**Note**
A single DTMF sequence can have multiple actions associated with it. This is accomplished by stringing the actions together and using a , as the delimiter. Example: Both listening and talking volume is reset when 5 is pressed. 5=reset_talking_volume,
reset_listening_volume

- playback(filename&filename2&...) - playback will play back an audio file to a channel and then immediately return to the conference. This file can not be interrupted by DTMF. Multiple files can be chained together using the s character.
- playback_and_continue(filename&filename2&...) - playback_and_continue will play back a prompt while continuing to collect the dtmf sequence. This is useful when using a menu prompt that describes all the menu options. Note however that any DTMF during this action will terminate the prompts playback. Prompt files can be chained together using the s character as a delimiter.
- toggle_mute - Toggle turning on and off mute. Mute will make the user silent to everyone else, but the user will still be able to listen in.
- no_op - This action does nothing (No Operation). Its only real purpose exists for being able to reserve a sequence in the config as a menu exit sequence.
- decrease_listening_volume - Decreases the channel's listening volume.
- increase_listening_volume - Increases the channel's listening volume.
- reset_listening_volume - Reset channel's listening volume to default level.
- decrease_talking_volume - Decreases the channel's talking volume.
- increase_talking_volume - Increases the channel's talking volume.
- reset_talking_volume - Reset channel's talking volume to default level.
- dialplan_exec(context,exten,priority) - The dialplan_exec action allows a user to escape from the conference and execute commands in the dialplan. Once the dialplan exits the user will be put back into the conference. The possibilities are endless!
- leave_conference - This action allows a user to exit the conference and continue execution in the dialplan.
- admin_kick_last - This action allows an Admin to kick the last participant from the conference. This action will only work for admins which allows a single menu to be used for both users and admins.
- admin_toggle_conference_lock - This action allows an Admin to toggle locking and unlocking the conference. Non admins can not use this action even if it is in their menu.
- set_as_single_video_src - This action allows any user to set themselves as the single video source distributed to all participants. This will make the video feed stick to them regardless of what the video_mode is set to.
- release_as_single_video_src - This action allows a user to release themselves as the video source. If video_mode is not set to n one this action will result in the conference returning to whatever video mode the bridge profile is using. Note that this action will have no effect if the user is not currently the video source. Also, the user is not guaranteed by using this action that they will not become the video source again. The bridge will return to whatever operation the video_mode option is set to upon release of the video src.
- admin_toggle_mute_participants - This action allows an administrator to toggle the mute state for all non-admins within a conference. All admin users are unaffected by this option. Note that all users, regardless of their admin status, are notified that the conference is muted.
- participant_count - This action plays back the number of participants currently in a conference

Call Detail Record configuration

This configuration documentation is for functionality provided by cdr.

Overview

CDR is Call Detail Record, which provides logging services via a variety of pluggable backend modules. Detailed call information can be recorded to databases, files, etc. Useful for billing, fraud prevention, compliance with Sarbanes-Oxley aka The Enron Act, QOS evaluations, and more.

cdr.conf

general

Global settings applied to the CDR engine.

<td>false</td>
<td>Block shutdown of Asterisk until CDRs are submitted</td>
</tr>
</tbody>
</table>

Configuration Option Descriptions

debug

When set to True, verbose updates of changes in CDR information will be logged. Note that this is only of use when debugging CDR behavior.

eable

Define whether or not to use CDR logging. Setting this to "no" will override any loading of backend CDR modules. Default is "yes".

unanswered

Define whether or not to log unanswered calls that don’t involve an outgoing party. Setting this to "yes" will make calls to extensions that don’t answer and don’t set a side B channel (such as by using the Dial application) receive CDR log entries. If this option is set to "no", then those log entries will not be created. Unanswered calls which get offered to an outgoing line will always receive log entries regardless of this option, and that is the intended behavior.

congestion

Define whether or not to log congested calls. Setting this to "yes" will report each call that fails to complete due to congestion conditions.

dbeforehexten
As each CDR for a channel is finished, its end time is updated and the CDR is finalized. When a channel is hung up and hangup logic is present (in the form of a hangup handler or the \( h \) extension), a new CDR is generated for the channel. Any statistics are gathered from this new CDR. By enabling this option, no new CDR is created for the dialplan logic that is executed in \( h \) extensions or attached hangup handler subroutines. The default value is \( yes \), indicating that a CDR will be generated during hangup logic.

### initiatedseconds

Normally, the \( \text{billsec} \) field logged to the CDR backends is simply the end time (hangup time) minus the answer time in seconds. Internally, asterisk stores the time in terms of microseconds and seconds. By setting \( \text{initiatedseconds} \) to \( yes \), you can force asterisk to report any seconds that were initiated (a sort of round up method). Technically, this is when the microsecond part of the end time is greater than the microsecond part of the answer time, then the billsec time is incremented one second.

### batch

Define the CDR batch mode, where instead of posting the CDR at the end of every call, the data will be stored in a buffer to help alleviate load on the asterisk server.

**Warning**

Use of batch mode may result in data loss after unsafe asterisk termination, i.e., software crash, power failure, kill -9, etc.

### size

Define the maximum number of CDRs to accumulate in the buffer before posting them to the backend engines. \( \text{batch} \) must be set to \( yes \).

### time

Define the maximum time to accumulate CDRs before posting them in a batch to the backend engines. If this time limit is reached, then it will post the records, regardless of the value defined for \( size \). \( \text{batch} \) must be set to \( yes \).

**Note**

Time is expressed in seconds.

### scheduleronly

The CDR engine uses the internal asterisk scheduler to determine when to post records. Posting can either occur inside the scheduler thread, or a new thread can be spawned for the submission of every batch. For small batches, it might be acceptable to just use the scheduler thread, so set this to \( yes \). For large batches, say anything over \( size=10 \), a new thread is recommended, so set this to \( no \).

### safeshutdown

When shutting down asterisk, you can block until the CDRs are submitted. If you don't, then data will likely be lost. You can always check the size of the CDR batch buffer with the CLI \( \text{cdr status} \) command. To enable blocking on submission of CDR data during asterisk shutdown, set this to \( yes \).
Asterisk 14 Configuration_cel

This configuration documentation is for functionality provided by cel.

cel.conf

Asterisk 14 Configuration_chan_motif

Jingle Channel Driver

This configuration documentation is for functionality provided by chan_motif.

Overview

Transports

There are three different transports and protocol derivatives supported by chan_motif. They are in order of preference: Jingle using ICE-UDP, Google Jingle, and Google-V1.

Jingle as defined in XEP-0166 supports the widest range of features. It is referred to as ice-udp. This is the specification that Jingle clients implement.

Google Jingle follows the Jingle specification for signaling but uses a custom transport for media. It is supported by the Google Talk Plug-in in Gmail and by some other Jingle clients. It is referred to as google in this file.

Google-V1 is the original Google Talk signaling protocol which uses an initial preliminary version of Jingle. It also uses the same custom transport as Google Jingle for media. It is supported by Google Voice, some other Jingle clients, and the Windows Google Talk client. It is referred to as google-v1 in this file.

Incoming sessions will automatically switch to the correct transport once it has been determined.

Outgoing sessions are capable of determining if the target is capable of Jingle or a Google transport if the target is in the roster. Unfortunately it is not possible to differentiate between a Google Jingle or Google-V1 capable resource until a session initiate attempt occurs. If a resource is determined to use a Google transport it will initially use Google Jingle but will fall back to Google-V1 if required.

If an outgoing session attempt fails due to failure to support the given transport chan_motif will fall back in preference order listed previously until all transports have been exhausted.

Dialing and Resource Selection Strategy

Placing a call through an endpoint can be accomplished using the following dial string:

Motif/endpoint name/target

When placing an outgoing call through an endpoint the requested target is searched for in the roster list. If present the first Jingle or Google Jingle capable resource is specifically targeted. Since the capabilities of the resource are known the outgoing session initiation will disregard the configured transport and use the determined one.

If the target is not found in the roster the target will be used as-is and a session will be initiated using the transport specified in this configuration file. If no transport has been specified the endpoint defaults to ice-udp.

Video Support

Support for video does not need to be explicitly enabled. Configuring any video codec on your endpoint will automatically enable it.

DTMF

The only supported method for DTMF is RFC2833. This is always enabled on audio streams and negotiated if possible.

Incoming Calls

Incoming calls will first look for the extension matching the name of the endpoint in the configured context. If no such extension exists the call will automatically fall back to the s extension.

CallerID

The incoming caller id number is populated with the username of the caller and the name is populated with the full identity of the caller. If you would like to perform authentication or filtering of incoming calls it is recommended that you use these fields to do so.

Outgoing caller id can not be set.

Warning
Multiple endpoints using the same connection is NOT supported. Doing so may result in broken calls.

motif.conf

endpoint

The configuration for an endpoint.

**Configuration Option Descriptions**

**transport**

The default outbound transport for this endpoint. Inbound messages are inferred. Allowed transports are ice-udp, google, or google-v1. Note that chan_motif will fall back to transport preference order if the transport value chosen here fails.

- **ice-udp** - The Jingle protocol, as defined in XEP 0166.
- **google** - The Google Jingle protocol, which follows the Jingle specification for signaling but uses a custom transport for media.
- **google-v1** - Google-V1 is the original Google Talk signaling protocol which uses an initial preliminary version of Jingle. It also uses the same custom transport as google for media.

Configuration Option Descriptions

atxferdropcall

When this option is set to no, then Asterisk will attempt to re-call the transferrer if the call to the transfer target fails. If the call to the transferrer fails, then Asterisk will wait atxferloopdelay milliseconds and then attempt to dial the transfer target again. This process will repeat until atxfercallbackretries attempts to re-call the transferrer have occurred.

When this option is set to yes, then Asterisk will not attempt to re-call the transferrer if the call to the transfer target fails. Asterisk will instead hang up all channels involved in the transfer.

xfersound
This sound will play to the transferrer and transfer target channels when an attended transfer completes. This sound is also played to channels when performing an AMI Bridge action.

**atxferabort**

This option is only available to the transferrer during an attended transfer operation. Aborting a transfer results in the transfer being cancelled and the original parties in the call being re-bridged.

**atxfercomplete**

This option is only available to the transferrer during an attended transfer operation. Completing the transfer with a DTMF sequence is functionally equivalent to hanging up the transferrer channel during an attended transfer. The result is that the transfer target and transferees are bridged.

**atxferthreeway**

This option is only available to the transferrer during an attended transfer operation. Pressing this DTMF sequence will result in the transferrer, the transferees, and the transfer target all being in a single bridge together.

**atxferswap**

This option is only available to the transferrer during an attended transfer operation. Pressing this DTMF sequence will result in the transferrer swapping which party he is bridged with. For instance, if the transferrer is currently bridged with the transfer target, then pressing this DTMF sequence will cause the transferrer to be bridged with the transferees.

**pickupexten**

In order for the pickup attempt to be successful, the party attempting to pick up the call must either have a namedpickupgroup in common with a ringing party’s namedcallgroup or must have a pickupgroup in common with a ringing party’s callgroup.

**featuremap**

DTMF options that can be triggered during bridged calls

### Configuration Option Descriptions

**atxfer**

The transferee parties will be placed on hold and the transferrer may dial an extension to reach a transfer target. During an attended transfer, the transferrer may consult with the transfer target before completing the transfer. Once the transferrer has hung up or pressed the atxfercomplete DTMF sequence, then the transferees and transfer target will be bridged.

**blindxfer**

The transferee parties will be placed on hold and the transferrer may dial an extension to reach a transfer target. During a blind transfer, as soon as the transfer target is dialed, the transferrer is hung up.

**disconnect**

Entering this DTMF sequence will cause the bridge to end, no matter the number of parties present.
parkcall

The parking lot used to park the call is determined by using either the PARKINGLOT channel variable or a configured value on the channel (provided by the channel driver) if the variable is not present. If no configured value on the channel is present, then "default" is used. The call is parked in the next available space in the parking lot.

automon

This will cause the channel that pressed the DTMF sequence to be monitored by the Monitor application. The format for the recording is determined by the TOUCH_MONITOR_FORMAT channel variable. If this variable is not specified, then wav is the default. The filename is constructed in the following manner:

prefix-timestamp-filename

where prefix is either the value of the TOUCH_MONITOR_PREFIX channel variable or auto if the variable is not set. The timestamp is a UNIX timestamp. The filename is either the value of the TOUCH_MONITOR channel variable or the callerID of the channels if the variable is not set.

automixmon

Operation of the automixmon is similar to the {{ automon }} feature, with the following exceptions: TOUCH_MIXMONITOR is used in place of TOUCH_MON ITOR TOUCH_MIXMONITOR_FORMAT is used in place of TOUCH_MIXMONITOR. There is no equivalent for TOUCH_MONITOR_PREFIX. "auto" is always how the filename begins.

applicationmap

Section for defining custom feature invocations during a call

**Configuration Option Reference**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Type</th>
<th>Default Value</th>
<th>Regular Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.*</td>
<td>Custom</td>
<td>true</td>
<td>true</td>
<td>A custom feature to invoke during a bridged call</td>
</tr>
</tbody>
</table>

**Configuration Option Descriptions**

.

Each item listed here is a comma-separated list of parameters that determine how a feature may be invoked during a call.

Example:

eggs = *5,self,Playback(hello-world),default

This would create a feature called eggs that could be invoked during a call by pressing the *5. The party that presses the DTMF sequence would then trigger the Playback application to play the hello-world file. The application invocation would happen on the party that pressed the DTMF sequence since self is specified. The other parties in the bridge would hear the default music on hold class during the playback.

In addition to the syntax outlined in this documentation, a backwards-compatible alternative is also allowed. The following applicationmap lines are functionally identical:

eggs = *5,self,Playback(hello-world),default

eggs = *5,self,Playback,hello-world,default

eggs = *5,self,Playback,"hello-world",default

featuregroup

Groupings of items from the applicationmap

**Configuration Option Reference**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Type</th>
<th>Default Value</th>
<th>Regular Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.*</td>
<td>Custom</td>
<td>true</td>
<td>true</td>
<td>Applicationmap item to place in the feature group</td>
</tr>
</tbody>
</table>

**Configuration Option Descriptions**
Each item here must be a name of an item in the applicationmap. The argument may either be a new DTMF sequence to use for the item or it may be left blank in order to use the DTMF sequence specified in the applicationmap. For example:

eggs => *1
bacon =>

would result in the applicationmap items eggs and bacon being in the featuregroup. The former would have its default DTMF trigger overridden with *1 and the latter would have the DTMF value specified in the applicationmap.

</tr>
</thead>
<tbody>
<tr>
<td>parkeddynamic</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>Enables dynamically created parking lots.</td>
</tr>
</tbody>
</table>

Configuration Option Descriptions

parkeddynamic

If the option is enabled then the following variables can be used to dynamically create new parking lots.

The PARKINGDYNAMIC variable specifies the parking lot to use as a template to create a dynamic parking lot. It is an error to specify a non-existent parking lot for the template. If not set then the default parking lot is used as the template.

The PARKINGDYNCONTEXT variable specifies the dialplan context to use for the newly created dynamic parking lot. If not set then the context from the parking lot template is used. The context is created if it does not already exist and the new parking lot needs to create extensions.

The PARKINGDYNEXTEN variable specifies the parkext to use for the newly created dynamic parking lot. If not set then the parkext is used from the parking lot template. If the template does not specify a parkext then no extensions are created for the newly created parking lot. The dynamic parking lot cannot be created if it needs to create extensions that overlap existing parking lot extensions. The only exception to this is for the parkext extension and only if neither of the overlapping parking lot's parkext is exclusive.

The PARKINGDYNPOS variable specifies the parking positions to use for the newly created dynamic parking lot. If not set then the parkpos from the parking lot template is used.

</tbody>
</table>

**Configuration Option Descriptions**

**context**

This option is only used if parkext is set.

**parkext**

If this option is used, this extension will automatically be created to place calls into parking lots. In addition, if parkext_exclusive is set for this parking lot, the name of the parking lot will be included in the application's arguments so that it only parks to this parking lot. The extension will be created in context. Using this option also creates extensions for retrieving parked calls from the parking spaces in the same context.

**Note**

Generated parking extensions cannot overlap. The only exception is if neither overlapping parkext is exclusive.

**parkpos**

If parkext is set, these extensions will automatically be mapped in context in order to pick up calls parked to these parking spaces.

**comebacktoorigin**

Valid Options:

- **yes** - Automatically have the parked channel dial the device that parked the call with dial timeout set by the parkingtime option. When the call times out an extension to dial the PARKER will automatically be created in the park-dial context with an extension of the flattened parker device name. If the call is not answered, the parked channel that is timing out will continue in the dial plan at that point if there are more priorities in the extension (which won't be the case unless the dialplan deliberately includes such priorities in the park-dial context through pattern matching or deliberately written flattened peer extensions).
- **no** - Place the call into the PBX at comebackcontext instead. The extension will still be set as the flattened peer name. If an extension the flattened peer name isn’t available then it will fall back to the $extension. If that also is unavailable it will attempt to fall back to $efault. The normal dial extension will still be created in the park-dial context with the extension also being the flattened peer name.

**Note**

Flattened Peer Names - Extensions can not include slash characters since those are used for pattern matching. When a peer name is flattened, slashes become underscores. For example if the parker of a call is called SIP/0004F2040001 then flattened peer name and therefore the extensions created and used on timeouts will be SIP_0004F204001.

**Note**

When parking times out and the channel returns to the dial plan, the following variables are set:

- PARKING_SPACE - extension that the call was parked in prior to timing out.
- PARKINGSLOT - Deprecated. Use PARKING_SPACE instead.
- **PARKEDLOT** - name of the lot that the call was parked in prior to timing out.
- **PARKER** - The device that parked the call
- **PARKER_FLAT** - The flat version of PARKER

### comebackcontext

The extension the call enters will prioritize the flattened peer name in this context. If the flattened peer name extension is unavailable, then the ‘s’ extension in this context will be used. If that also is unavailable, the ‘s’ extension in the ‘default’ context will be used.

### courtesytone

By default, this tone is only played to the caller of a parked call. Who receives the tone can be changed using the parkedplay option.

### parkedplay

- **no** - Apply to neither side.
- **caller** - Apply only to the call connecting with the call coming out of the parking lot.
- **callee** - Apply only to the call coming out of the parking lot.
- **both** - Apply to both sides.

**Note**
If courtesy tone is not specified then this option will be ignored.

### parkedcalltransfers

- **no** - Apply to neither side.
- **caller** - Apply only to the call connecting with the call coming out of the parking lot.
- **callee** - Apply only to the call coming out of the parking lot.
- **both** - Apply to both sides.

### parkedcallreparking

- **no** - Apply to neither side.
- **caller** - Apply only to the call connecting with the call coming out of the parking lot.
- **callee** - Apply only to the call coming out of the parking lot.
- **both** - Apply to both sides.

### parkedcallhangup

- **no** - Apply to neither side.
- **caller** - Apply only to the call connecting with the call coming out of the parking lot.
- **callee** - Apply only to the call coming out of the parking lot.
- **both** - Apply to both sides.

### parkedcallrecording

- **no** - Apply to neither side.
- **caller** - Apply only to the call connecting with the call coming out of the parking lot.
- **callee** - Apply only to the call coming out of the parking lot.
- **both** - Apply to both sides.

### findslot

- **first** - Always try to place in the lowest available space in the parking lot
- **next** - Track the last parking space used and always attempt to use the one immediately after.

- no
- required
- yes

**aggregate_mwi**
When enabled, `aggregate_mwi` condenses message waiting notifications from multiple mailboxes into a single NOTIFY. If it is disabled, individual NOTIFYs are sent for each mailbox.

**aors**
List of comma separated AoRs that the endpoint should be associated with.

**auth**
This is a comma-delimited list of `auth` sections defined in `pjsip.conf` to be used to verify inbound connection attempts.

Endpoints without an `authentication` object configured will allow connections without verification.

callerid

Must be in the format `Name <Number>`, or only `<Number>`.

callerid_privacy

- allowed_not_screened
- allowed_passed_screen
- allowed_failed_screen
- allowed
- prohib_not_screened
- prohib_passed_screen
- prohib_failed_screen
- prohib
- unavailable

direct_media_glare_mitigation

This setting attempts to avoid creating INVITE glare scenarios by disabling direct media reINVITEs in one direction thereby allowing designated servers (according to this option) to initiate direct media reINVITEs without contention and significantly reducing call setup time.

A more detailed description of how this option functions can be found on the Asterisk wiki [https://wiki.asterisk.org/wiki/display/AST/SIP+Direct+Media+Reinvite+Glare+Avoidance](https://wiki.asterisk.org/wiki/display/AST/SIP+Direct+Media+Reinvite+Glare+Avoidance)

- none
- outgoing
- incoming

direct_media_method

Method for setting up Direct Media between endpoints.

- invite
- reinvite - Alias for the `invite` value.
- update

c connected_line_method

Method used when updating connected line information.

- invite
- reinvite - Alias for the `invite` value.
- update

dtmf_mode

This setting allows to choose the DTMF mode for endpoint communication.

- rfc4733 - DTMF is sent out of band of the main audio stream. This supercedes the older RFC-2833 used within the older `chan_sip`.
- inband - DTMF is sent as part of audio stream.
- info - DTMF is sent as SIP INFO packets.
- auto - DTMF is sent as RFC 4733 if the other side supports it or as INBAND if not.

media_address

At the time of SDP creation, the IP address defined here will be used as the media address for individual streams in the SDP.

**Note**

Be aware that the `external_media_address` option, set in Transport configuration, can also affect the final media address used in the SDP.

bind_rtp_to_media_address
If media_address is specified, this option causes the RTP instance to be bound to the specified ip address which causes the packets to be sent from that address.

**identify_by**

Endpoints and aors can be identified in multiple ways. Currently, the supported options are `username`, which matches the endpoint or aor id based on the username and domain in the From header (or To header for aors), and `auth_username`, which matches the endpoint or aor id based on the username and realm in the Authentication header. In all cases, if an exact match on both username and domain/realm fails, the match will be retried with just the username.

**Note**

Identification by `auth_username` has some security considerations because an Authentication header is not present on the first message of a dialog when digest authentication is used. The client can't generate it until the server sends the challenge in a 401 response. Since Asterisk normally sends a security event when an incoming request can't be matched to an endpoint, using `auth_username` requires that the security event be deferred until a request is received with the Authentication header and only generated if the username doesn't result in a match. This may result in a delay before an attack is recognized. You can control how many unmatched requests are received from a single ip address before a security event is generated using the unidentified_request parameters in the "global" configuration object.

**Note**

Endpoints can also be identified by IP address; however, that method of identification is not handled by this configuration option. See the documentation for the `identify configuration` section for more details on that method of endpoint identification. If this option is set and an `identify` configuration section exists for the endpoint, then the endpoint can be identified in multiple ways.

- `username`
- `auth_username`

**redirect_method**

When a redirect is received from an endpoint there are multiple ways it can be handled. If this option is set to `user` the user portion of the redirect target is treated as an extension within the dialplan and dialed using a Local channel. If this option is set to `uri_core` the target URI is returned to the dialing application which dials it using the PJSIP channel driver and endpoint originally used. If this option is set to `uri_pjsip` the redirect occurs within chan_pjsip itself and is not exposed to the core at all. The `uri_pjsip` option has the benefit of being more efficient and also supporting multiple potential redirect targets. The con is that since redirection occurs within chan_pjsip redirecting information is not forwarded and redirection can not be prevented.

- `user`
- `uri_core`
- `uri_pjsip`

**mailboxes**

Asterisk will send unsolicited MWI NOTIFY messages to the endpoint when state changes happen for any of the specified mailboxes. More than one mailbox can be specified with a comma-delimited string. app_voicemail mailboxes must be specified as mailbox@context; for example: `mailboxes=6001@default`. For mailboxes provided by external sources, such as through the res_external_mwi module, you must specify strings supported by the external system.

For endpoints that SUBSCRIBE for MWI, use the `mailboxes` option in your AOR configuration.

**rewrite_contact**

On inbound SIP messages from this endpoint, the Contact header or an appropriate Record-Route header will be changed to have the source IP address and port. This option does not affect outbound messages sent to this endpoint.

**rpid_immediate**

When enabled, immediately send 180 Ringing or 183 Progress response messages to the caller if the connected line information is updated before the call is answered. This can send a 180 Ringing response before the call has even reached the far end. The caller can start hearing ringback before the far end even gets the call. Many phones tend to grab the first connected line information and refuse to update the display if it changes. The first information is not likely to be correct if the call goes to an endpoint not under the control of this Asterisk box.

When disabled, a connected line update must wait for another reason to send a message with the connected line information to the caller before the call is answered. You can trigger the sending of the information by using an appropriate dialplan application such as Ringing.

**timers_min_se**

Minimum session timer expiration period. Time in seconds.
timers

- no
- yes
- required
- always
- forced - Alias of always

**timers_sess_expires**

Maximum session timer expiration period. Time in seconds.

**transport**

This will set the desired transport configuration to send SIP data through.

**Warning**

Not specifying a transport will **DEFAULT** to the first configured transport in **pjsip.conf** which is valid for the URI we are trying to contact.

**Warning**

Transport configuration is not affected by reloads. In order to change transports, a full Asterisk restart is required.

**trust_id_inbound**

This option determines whether Asterisk will accept identification from the endpoint from headers such as P-Asserted-Identity or Remote-Party-ID header. This option applies both to calls originating from the endpoint and calls originating from Asterisk. If **no**, the configured Caller-ID from pjsip.conf will always be used as the identity for the endpoint.

**trust_id_outbound**

This option determines whether res_pjsip will send private identification information to the endpoint. If **no**, private Caller-ID information will not be forwarded to the endpoint. "Private" in this case refers to any method of restricting identification. Example: setting callerid_privacy to any **prohib** variation. Example: If **trust_id_inbound** is set to **yes**, the presence of a **Privacy: id** header in a SIP request or response would indicate the identification provided in the request is private.

**use_avpf**

If set to **yes**, res_pjsip will use the AVPF or SAVPF RTP profile for all media offers on outbound calls and media updates and will decline media offers not using the AVPF or SAVPF profile.

If set to **no**, res_pjsip will use the AVP or SAVP RTP profile for all media offers on outbound calls and media updates, and will decline media offers not using the AVP or SAVP profile.

**force_avp**

If set to **yes**, res_pjsip will use the AVP, AVPF, SAVP, or SAVPF RTP profile for all media offers on outbound calls and media updates including those for DTLS-SRTP streams.

If set to **no**, res_pjsip will use the respective RTP profile depending on configuration.

**media_use_received_transport**

If set to **yes**, res_pjsip will use the received media transport.

If set to **no**, res_pjsip will use the respective RTP profile depending on configuration.

**media_encryption**

- **no** - res_pjsip will offer no encryption and allow no encryption to be setup.
- **sdes** - res_pjsip will offer standard SRTP setup via in-SDP keys. Encrypted SIP transport should be used in conjunction with this option to prevent exposure of media encryption keys.
- **dtls** - res_pjsip will offer DTLS-SRTP setup.
media_encryption_optimistic

This option only applies if media_encryption is set to sdes or dtls.

g726_non_standard

When set to "yes" and an endpoint negotiates g.726 audio then use g.726 for AAL2 packing order instead of what is recommended by RFC3551. Since this essentially replaces the underlying 'g726' codec with 'g726aal2' then 'g726aal2' needs to be specified in the endpoint's allowed codec list.

inband_progress

If set to yes, chan_pjsip will send a 183 Session Progress when told to indicate ringing and will immediately start sending ringing as audio.

If set to no, chan_pjsip will send a 180 Ringing when told to indicate ringing and will NOT send it as audio.

call_group

Can be set to a comma separated list of numbers or ranges between the values of 0-63 (maximum of 64 groups).

pickup_group

Can be set to a comma separated list of numbers or ranges between the values of 0-63 (maximum of 64 groups).

named_call_group

Can be set to a comma separated list of case sensitive strings limited by supported line length.

named_pickup_group

Can be set to a comma separated list of case sensitive strings limited by supported line length.

device_state_busy_at

When the number of in-use channels for the endpoint matches the devicestate_busy_at setting the PJSIP channel driver will return busy as the device state instead of in use.

t38_udptl

If set to yes T.38 UDPTL support will be enabled, and T.38 negotiation requests will be accepted and relayed.

t38_udptl_ec

- none - No error correction should be used.
- fec  - Forward error correction should be used.
- redundancy  - Redundancy error correction should be used.

t38_udptl_maxdatagram

This option can be set to override the maximum datagram of a remote endpoint for broken endpoints.

fax_detect

This option can be set to send the session to the fax extension when a CNG tone is detected.

fax_detect_timeout

The option determines how many seconds into a call before the fax_detect option is disabled for the call. Setting the value to zero disables the timeout.

t38_udptl_nat
When enabled the UDPTL stack will send UDPTL packets to the source address of received packets.

**t38_udptl_ipv6**

When enabled the UDPTL stack will use IPv6.

**record_on_feature**

When an INFO request for one-touch recording arrives with a Record header set to "on", this feature will be enabled for the channel. The feature designated here can be any built-in or dynamic feature defined in features.conf.

**Note**

This setting has no effect if the endpoint's one_touch_recording option is disabled

**record_off_feature**

When an INFO request for one-touch recording arrives with a Record header set to "off", this feature will be enabled for the channel. The feature designated here can be any built-in or dynamic feature defined in features.conf.

**Note**

This setting has no effect if the endpoint's one_touch_recording option is disabled

**tos_audio**

See [https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service](https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service) for more information about QoS settings

**tos_video**

See [https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service](https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service) for more information about QoS settings

**cos_audio**

See [https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service](https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service) for more information about QoS settings

**cos_video**

See [https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service](https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service) for more information about QoS settings

**dtls_verify**

This option only applies if `media_encryption` is set to `dtls`.

**dtls_rekey**

This option only applies if `media_encryption` is set to `dtls`.

If this is not set or the value provided is 0 rekeying will be disabled.

**dtls_cert_file**

This option only applies if `media_encryption` is set to `dtls`.

**dtls_private_key**

This option only applies if `media_encryption` is set to `dtls`.

**dtls_cipher**

This option only applies if `media_encryption` is set to `dtls`.
Many options for acceptable ciphers. See link for more:
http://www.openssl.org/docs/apps/ciphers.html#CIPHER\_STRINGS

**dtls_ca_file**

This option only applies if *media_encryption* is set to *dtls*.

**dtls_ca_path**

This option only applies if *media_encryption* is set to *dtls*.

**dtls_setup**

This option only applies if *media_encryption* is set to *dtls*.

- active - *res_pjsip* will make a connection to the peer.
- passive - *res_pjsip* will accept connections from the peer.
- actpass - *res_pjsip* will offer and accept connections from the peer.

**dtls_fingerprint**

This option only applies if *media_encryption* is set to *dtls*.

- SHA-256
- SHA-1

**srtp_tag_32**

This option only applies if *media_encryption* is set to *sdes* or *dtls*.

**set_var**

When a new channel is created using the endpoint set the specified variable(s) on that channel. For multiple channel variables specify multiple 'set_var'(s).

**message_context**

If specified, incoming MESSAGE requests will be routed to the indicated dialplan context. If no *message_context* is specified, then the *context* setting is used.

**accountcode**

If specified, any channel created for this endpoint will automatically have this accountcode set on it.

**rtp_keepalive**

At the specified interval, Asterisk will send an RTP comfort noise frame. This may be useful for situations where Asterisk is behind a NAT or firewall and must keep a hole open in order to allow for media to arrive at Asterisk.

**rtp_timeout**

This option configures the number of seconds without RTP (while off hold) before considering a channel as dead. When the number of seconds is reached the underlying channel is hung up. By default this option is set to 0, which means do not check.

**rtp_timeout_hold**

This option configures the number of seconds without RTP (while on hold) before considering a channel as dead. When the number of seconds is reached the underlying channel is hung up. By default this option is set to 0, which means do not check.

**acl**

This matches sections configured in *acl.conf*. The value is defined as a list of comma-delimited section names.
deny
The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash ('/').

permit
The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash ('/').

contact_acl
This matches sections configured in acl.conf. The value is defined as a list of comma-delimited section names.

contact_deny
The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash ('/').

contact_permit
The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash ('/').

subscribe_context
If specified, incoming SUBSCRIBE requests will be searched for the matching extension in the indicated context. If no subscribe_context is specified, then the context setting is used.

auth
Authentication type

### Configuration Option Reference

### Configuration Option Descriptions

auth_type
This option specifies which of the password style config options should be read when trying to authenticate an endpoint inbound request. If set to userpass then we'll read from the 'password' option. For md5 we'll read from 'md5_cred'.

- md5
- userpass

md5_cred
Only used when auth_type is md5.
password

Only used when auth_type is userpass.

domain_alias

Domain Alias

Content is licensed under a Creative Commons Attribution-ShareAlike 3.0 United States License.
Configuration Option Descriptions

**cert_file**
A path to a .crt or .pem file can be provided. However, only the certificate is read from the file, not the private key. The `priv_key_file` option must supply a matching key file.

**cipher**
Comma separated list of cipher names or numeric equivalents. Numeric equivalents can be either decimal or hexadecimal (0xX).

There are many cipher names. Use the CLI command `pjsip list ciphers` to see a list of cipher names available for your installation. See link for more:

http://www.openssl.org/docs/apps/ciphers.html#CIPHER_SUITE_NAMES

**external_media_address**
When a request or response is sent out, if the destination of the message is outside the IP network defined in the option `localnet`, and the media address in the SDP is within the localnet network, then the media address in the SDP will be rewritten to the value defined for `external_media_address`.

**method**
- `default` - The default as defined by PJSIP. This is currently TLSv1, but may change with future releases.
- `unspecified` - This option is equivalent to setting `default`
- `tlsv1`
- `sslv2`
- `sslv3`
- `sslv23`

**local_net**
This must be in CIDR or dotted decimal format with the IP and mask separated with a slash (`/`).

**protocol**
- `udp`
- `tcp`
- `tls`
- `ws`
- `wss`

**tos**
See https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service for more information on this parameter.

**Note**
This option does not apply to the ws or the wss protocols.

**cos**
See https://wiki.asterisk.org/wiki/display/AST/IP+Quality+of+Service for more information on this parameter.

**Note**
This option does not apply to the ws or the wss protocols.

**websocket_write_timeout**
If a websocket connection accepts input slowly, the timeout for writes to it can be increased to keep it from being disconnected. Value is in milliseconds; default is 100 ms.
allow_reload

Allow this transport to be reloaded when res_pjsip is reloaded. This option defaults to "no" because reloading a transport may disrupt in-progress calls.

contact

A way of creating an aliased name to a SIP URI

Configuration Option Descriptions

expiration_time

Time to keep alive a contact. String style specification.

qualify_frequency

Interval between attempts to qualify the contact for reachability. If 0 never qualify. Time in seconds.

qualify_timeout

If the contact doesn't respond to the OPTIONS request before the timeout, the contact is marked unavailable. If 0 no timeout. Time in fractional seconds.

authenticate_qualify

If true and a qualify request receives a challenge or authenticate response authentication is attempted before declaring the contact available.

outbound_proxy

If set the provided URI will be used as the outbound proxy when an OPTIONS request is sent to a contact for qualify purposes.

user_agent

The User-Agent is automatically stored based on data present in incoming SIP REGISTER requests and is not intended to be configured manually.
endpoint
The name of the endpoint this contact belongs to

reg_server
Asterisk Server name on which SIP endpoint registered.

via_addr
The last Via header should contain the address of UA which sent the request. The IP-address of the last Via header is automatically stored based on data present in incoming SIP REGISTER requests and is not intended to be configured manually.

via_port
The IP-port of the last Via header is automatically stored based on data present in incoming SIP REGISTER requests and is not intended to be configured manually.

call_id
The Call-ID header is automatically stored based on data present in incoming SIP REGISTER requests and is not intended to be configured manually.

aor
The configuration for a location of an endpoint

<td>false</td>
<td>Enables Path support for REGISTER requests and Route support for other requests.</td>
</tr>
</tbody>
</table>

### Configuration Option Descriptions

**contact**
Contacts specified will be called whenever referenced by chan_pjsip.

Use a separate “contact=” entry for each contact required. Contacts are specified using a SIP URI.

mailboxes

This option applies when an external entity subscribes to an AoR for Message Waiting Indications. The mailboxes specified will be subscribed to. More than one mailbox can be specified with a comma-delimited string. app_voicemail mailboxes must be specified as mailbox@context; for example: mailboxes=6001@default. For mailboxes provided by external sources, such as through the res_external_mwi module, you must specify strings supported by the external system.

For endpoints that cannot SUBSCRIBE for MWI, you can set the mailboxes option in your endpoint configuration section to enable unsolicited MWI NOTIFYs to the endpoint.

maximum_expiration

Maximum time to keep a peer with explicit expiration. Time in seconds.

max_contacts

Maximum number of contacts that can associate with this AoR. This value does not affect the number of contacts that can be added with the "contact" option. It only limits contacts added through external interaction, such as registration.

Note

This should be set to 1 and remove_existing set to yes if you wish to stick with the older chan_sip behaviour.

minimum_expiration

Minimum time to keep a peer with an explicit expiration. Time in seconds.

remove_existing

On receiving a new registration to the AoR should it remove the existing contact that was registered against it?

Note

This should be set to yes and max_contacts set to 1 if you wish to stick with the older chan_sip behaviour.

qualify_frequency

Interval between attempts to qualify the AoR for reachability. If 0 never qualify. Time in seconds.

qualify_timeout

If the contact doesn’t respond to the OPTIONS request before the timeout, the contact is marked unavailable. If 0 no timeout. Time in fractional seconds.

authenticate_qualify

If true and a qualify request receives a challenge or authenticate response authentication is attempted before declaring the contact available.

outbound_proxy

If set the provided URI will be used as the outbound proxy when an OPTIONS request is sent to a contact for qualify purposes.

support_path

When this option is enabled, the Path headers in register requests will be saved and its contents will be used in Route headers for outbound out-of-dialog requests and in Path headers for outbound 200 responses. Path support will also be indicated in the Supported header.

system

Options that apply to the SIP stack as well as other system-wide settings.

</tbody>
</table>

**Configuration Option Descriptions**

**timer_t1**

Timer T1 is the base for determining how long to wait before retransmitting requests that receive no response when using an unreliable transport (e.g. UDP). For more information on this timer, see RFC 3261, Section 17.1.1.1.

**timer_b**

Timer B determines the maximum amount of time to wait after sending an INVITE request before terminating the transaction. It is recommended that this be set to 64 * Timer T1, but it may be set higher if desired. For more information on this timer, see RFC 3261, Section 17.1.1.1.

**disable_tcp_switch**

Disable automatic switching from UDP to TCP transports if outgoing request is too large. See RFC 3261 section 18.1.1.

**global**

Options that apply globally to all SIP communications

**Configuration Option Reference**

</tr>
<tr>
<td>disable_multi_domain</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>Disable Multi Domain support</td>
</tr>
</tbody>
</table>
max_initial_qualify_time | Unsigned Integer | 0 | false | The maximum amount of time from startup that qualifies should be attempted on all contacts. If greater than the qualify_frequency for an aor, qualify_frequency will be used instead.

unidentified_request_period | Unsigned Integer | 5 | false | The number of seconds over which to accumulate unidentified requests.

unidentified_request_count | Unsigned Integer | 5 | false | The number of unidentified requests from a single IP to allow.

unidentified_request_prune_interval | Unsigned Integer | 30 | false | The interval at which unidentified requests are older than twice the unidentified_request_period are pruned.

type | None | false | Must be of type 'global'.

user_agent | String | Asterisk PBX GIT-14-46b4e67 | false | Value used in User-Agent header for SIP requests and Server header for SIP responses.

regcontext | String | false | When set, Asterisk will dynamically create and destroy a NoOp priority 1 extension for a given peer who registers or unregisters with us.

default_outbound_endpoint | String | default_outbound_endpoint | false | Endpoint to use when sending an outbound request to a URI without a specified endpoint.

default_voicemail_extension | String | false | The voicemail extension to send in the NOTIFY Message-Account header if not specified on endpoint or aor.

data | String | no | false | Enable/Disable SIP debug logging. Valid options include yes, no or a host address.

endpoint_identifier_order | String | ip,username,anonymous | false | The order by which endpoint identifiers are processed and checked. Identifier names are usually derived from and can be found in the endpoint identifier module itself (res_pjsip_endpoint_identifier_*). You can use the CLI command "pjsip show identifiers" to see the identifiers currently available.

default_from_user | String | asterisk | false | When Asterisk generates an outgoing SIP request, the From header username will be set to this value if there is no better option (such as CallerID) to be used.

default_realm | String | asterisk | false | When Asterisk generates an challenge, the digest will be set to this value if there is no better option (such as auth/realm) to be used.

**Configuration Option Descriptions**

**disable_multi_domain**

If disabled it can improve realtime performance by reducing number of database requests.
**unidentified_request_period**

If unidentified_request_count unidentified requests are received during unidentified_request_period, a security event will be generated.

**unidentified_request_count**

If unidentified_request_count unidentified requests are received during unidentified_request_period, a security event will be generated.

**endpoint_identifier_order**

**Note**

One of the identifiers is "auth_username" which matches on the username in an Authentication header. This method has some security considerations because an Authentication header is not present on the first message of a dialog when digest authentication is used. The client can't generate it until the server sends the challenge in a 401 response. Since Asterisk normally sends a security event when an incoming request can't be matched to an endpoint, using auth_username requires that the security event be deferred until a request is received with the Authentication header and only generated if the username doesn't result in a match. This may result in a delay before an attack is recognized. You can control how many unmatched requests are received from a single ip address before a security event is generated using the unidentified_request parameters.

**Import Version**

This documentation was imported from Asterisk Version Git-14-46b4e67
Asterisk 14 Configuration_res_pjsip_acl

SIP ACL module

This configuration documentation is for functionality provided by res_pjsip_acl.

Overview

ACL

The ACL module used by res_pjsip. This module is independent of endpoints and operates on all inbound SIP communication using res_pjsip.

There are two main ways of defining your ACL with the options provided. You can use the permit and deny options which act on IP addresses, or the contact_permit and contact_deny options which act on Contact header addresses in incoming REGISTER requests. You can combine the various options to create a mixed ACL.

Additionally, instead of defining an ACL with options, you can reference IP or Contact header ACLs from the file acl.conf by using the acl or contactacl options.

pjsip.conf

acl

Access Control List

Configuration Option Descriptions

acl

This matches sections configured in acl.conf. The value is defined as a list of comma-delimited section names.

contact_acl

This matches sections configured in acl.conf. The value is defined as a list of comma-delimited section names.

contact_deny

The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash (/)

contact_permit

The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash (/)

deny

The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or
dotted-decimal notation. Separate the IP address and subnet mask with a slash (/)

**permit**

The value is a comma-delimited list of IP addresses. IP addresses may have a subnet mask appended. The subnet mask may be written in either CIDR or dotted-decimal notation. Separate the IP address and subnet mask with a slash (/)

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Configuration_res_pjsip_config_wizard

Module that provides simple configuration wizard capabilities.

This configuration documentation is for functionality provided by res_pjsip_config_wizard.

Overview

PJSIP Configuration Wizard

This module allows creation of common PJSIP configuration scenarios without having to specify individual endpoint, aor, auth, identify and registration objects.

For example, the following configuration snippet would create the endpoint, aor, contact, auth and phoneprov objects necessary for a phone to get phone provisioning information, register, and make and receive calls. A hint is also created in the default context for extension 1000.

```
[myphone]
type = wizard
sends_auth = no
accepts_auth = yes
sends_registrations = no
accepts_registrations = yes
has_phoneprov = yes
transport = ipv4
has_hint = yes
hint_exten = 1000
inbound_auth/username = testname
inbound_auth/password = test password
endpoint/allow = ulaw
endpoint/context = default
phoneprov/MAC = 001122aa4455
phoneprov/PROFILE = profile1
```

The first 8 items are specific to the wizard. The rest of the items are passed verbatim to the underlying objects.

The following configuration snippet would create the endpoint, aor, contact, auth, identify and registration objects necessary for a trunk to another pbx or ITSP that requires registration.

```
[mytrunk]
type = wizard
sends_auth = yes
accepts_auth = no
sends_registrations = yes
accepts_registrations = no
transport = ipv4
remote_hosts = sip1.myitsp.com:5060,sip2.myitsp.com:5060
outbound_auth/username = testname
outbound_auth/password = test password
endpoint/allow = ulaw
endpoint/context = default
```

Of course, any of the items in either example could be placed into templates and shared among wizard objects.

For more information, visit:
pjsip_wizard.conf

wizard

Provides config wizard.

</tr>
</tbody>
</table>

### Configuration Option Descriptions

**transport**

If not specified, the default will be used.

**remote_hosts**

A comma-separated list of remote hosts in the form of `host[:port]`. If set, an aor static contact and an identify match will be created for each entry in the list. If send_registrations is also set, a registration will also be created for each.

**sends_auth**
At least outbound_auth/username is required.

accepts_auth
At least inbound_auth/username is required.

sendsRegistrations
remote_hosts is required and a registration object will be created for each host in the remote_hosts string. If authentication is required, sends_auth and an outbound_auth/username must also be supplied.

acceptsRegistrations
An AOR with dynamic contacts will be created. If the number of contacts needs to be limited, set aor/max_contacts.

hasPhoneprov
A phoneprov object will be created. phoneprov/MAC must be specified.

server_uri_pattern
The literal ${REMOTE_HOST} will be substituted with the appropriate remote_host for each registration.

client_uri_pattern
The literals ${REMOTE_HOST} and ${USERNAME} will be substituted with the appropriate remote_host and outbound_auth/username.

contact_pattern
The literal ${REMOTE_HOST} will be substituted with the appropriate remote_host for each contact.

hasHint
Create hint and optionally a default application.

hint_context
Ignored if hint_exten is not specified otherwise specifies the context into which the dialplan hints will be placed. If not specified, defaults to the endpoint's context or default if that isn't found.

hint_exten
Will create the following entry in hint_context:

```
exten => <hint_exten>,hint,PJSIP/<wizard_id>
```

Normal dialplan precedence rules apply so if there's already a hint for this extension in hint_context, this one will be ignored. For more information, visit: https://wiki.asterisk.org/wiki/display/AST/PJSIP+Configuration+Wizard

hint_application
Ignored if hint_exten isn't specified otherwise will create the following priority 1 extension in hint_context:

```
exten => <hint_exten>,1,<hint_application>
```

You can specify any valid extensions.conf application expression.

Examples:

```
Dial(${HINT})
Gosub(stdexten,${EXTEN},1(${HINT}))
```

Any extensions.conf style variables specified are passed directly to the dialplan.
Normal dialplan precedence rules apply so if there's already a priority 1 application for this specific extension in hint_context, this one will be ignored. For more information, visit:

https://wiki.asterisk.org/wiki/display/AST/PJSIP+Configuration+Wizard

**aor/**

If an aor/contact is explicitly defined then remote_hosts will not be used to create contacts automatically.

**identify/**

If an identify/match is explicitly defined then remote_hosts will not be used to create matches automatically.

**phoneprov/**

To activate phoneprov, at least phoneprov/MAC must be set.
Asterisk 14 Configuration_res_pjsip_endpoint_identifier_ip

Module that identifies endpoints via source IP address

This configuration documentation is for functionality provided by res_pjsip_endpoint_identifier_ip.

pjsip.conf

identify

Identifies endpoints via source IP address

**Configuration Option Reference**

<td>false</td>
<td>Must be of type 'registration'.</td>
</tr>
<tr>
<td>support_path</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>Enables Path support for outbound REGISTER requests.</td>
</tr>
</tbody>
</table>

Configuration Option Descriptions

auth_rejection_permanent

If this option is enabled and an authentication challenge fails, registration will not be attempted again until the configuration is reloaded.

client_uri

This is the address-of-record for the outbound registration (i.e. the URI in the To header of the REGISTER).
For registration with an ITSP, the client SIP URI may need to consist of an account name or number and the provider's hostname for their registrar, e.g. client_uri=1234567890@example.com. This may differ between providers.

For registration to generic registrars, the client SIP URI will depend on networking specifics and configuration of the registrar.

**forbidden_retry_interval**

If a 403 Forbidden is received, chan_pjsip will wait `forbidden_retry_interval` seconds before attempting registration again. If 0 is specified, chan_pjsip will not retry after receiving a 403 Forbidden response. Setting this to a non-zero value goes against a "SHOULD NOT" in RFC3261, but can be used to work around buggy registrars.

**fatal_retry_interval**

If a fatal response is received, chan_pjsip will wait `fatal_retry_interval` seconds before attempting registration again. If 0 is specified, chan_pjsip will not retry after receiving a fatal (non-temporary 4xx, 5xx, 6xx) response. Setting this to a non-zero value may go against a "SHOULD NOT" in RFC3261, but can be used to work around buggy registrars.

**server_uri**

This is the URI at which to find the registrar to send the outbound REGISTER. This URI is used as the request URI of the outbound REGISTER request from Asterisk.

For registration with an ITSP, the setting may often be just the domain of the registrar, e.g. sip:sip.example.com.

**transport**

**line**

When enabled this option will cause a ‘line’ parameter to be added to the Contact header placed into the outgoing registration request. If the remote server sends a call this line parameter will be used to establish a relationship to the outbound registration, ultimately causing the configured endpoint to be used.

**endpoint**

When line support is enabled this configured endpoint name is used for incoming calls that are related to the outbound registration.

**support_path**

When this option is enabled, outbound REGISTER requests will advertise support for Path headers so that intervening proxies can add to the Path header as necessary.

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Configuration_res_pjsip_phoneprov_provider

Module that integrates res_pjsip with res_phoneprov.

This configuration documentation is for functionality provided by res_pjsip_phoneprov_provider.

Overview

PJSIP Phoneprov Provider

This module creates the integration between res_pjsip and res_phoneprov.

Each user to be integrated requires a phoneprov section defined in pjsip.conf. Each section identifies the endpoint associated with the user and any other name/value pairs to be passed on to res_phoneprov's template substitution. Only MAC and PROFILE variables are required. Any other variables supplied will be passed through.

Example:

```
[1000]
type = phoneprovr
endpoint = ep1000
MAC = deadbeef4dad
PROFILE = grandstream2
LINEKEYS = 2
LINE = 1
OTHERVAR = othervalue
```

The following variables are automatically defined if an endpoint is defined for the user:

- **USERNAME** - Source: The user_name defined in the first auth reference in the endpoint.
- **SECRET** - Source: The user_pass defined in the first auth reference in the endpoint.
- **CALLERID** - Source: The number part of the callerid defined in the endpoint.
- **DISPLAY_NAME** - Source: The name part of the callerid defined in the endpoint.
- **LABEL** - Source: The id of the phoneprov section.

In addition to the standard variables, the following are also automatically defined:

- **ENDPOINT_ID** - Source: The id of the endpoint.
- **TRANSPORT_ID** - Source: The id of the transport used by the endpoint.
- **AUTH_ID** - Source: The id of the auth used by the endpoint.

All other template substitution variables must be explicitly defined in the phoneprov_default or phoneprov sections.

pjsip.conf

Phoneprov

Provides variables for each user.

<td>The name of a resource to report state on</td>
</tr>
<tr>
<td>full_state</td>
<td>Boolean</td>
<td>no</td>
<td>false</td>
<td>Indicates if the entire list's state should be sent out.</td>
</tr>
<tr>
<td>notification_batch_interval</td>
<td>Unsigned Integer</td>
<td>0</td>
<td>false</td>
<td>Time Asterisk should wait, in milliseconds, before sending notifications.</td>
</tr>
</tbody>
</table>

**Configuration Option Descriptions**

**event**

The SIP event package describes the types of resources that Asterisk reports the state of.

- presence - Device state and presence reporting.
- dialog - This is identical to presence.
- message-summary - Message-waiting indication (MWI) reporting.

**list_item**

In general Asterisk looks up list items in the following way:
1. Check if the list item refers to another configured resource list.

2. Pass the name of the resource off to event-package-specific handlers to find the specified resource.

The second part means that the way the list item is specified depends on what type of list this is. For instance, if you have the event set to `presence`, then list items should be in the form of `dialplan_extension@dialplan_context`. For `message-summary` mailbox names should be listed.

**full_state**

If this option is enabled, and a resource changes state, then Asterisk will construct a notification that contains the state of all resources in the list. If the option is disabled, Asterisk will construct a notification that only contains the states of resources that have changed.

Note

Even with this option disabled, there are certain situations where Asterisk is forced to send a notification with the states of all resources in the list. When a subscriber renews or terminates its subscription to the list, Asterisk MUST send a full state notification.

**notification_batch_interval**

When a resource's state changes, it may be desired to wait a certain amount before Asterisk sends a notification to subscribers. This allows for other state changes to accumulate, so that Asterisk can communicate multiple state changes in a single notification instead of rapidly sending many notifications.

**inbound-publication**

The configuration for inbound publications

### Configuration Option Reference

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Type</th>
<th>Default Value</th>
<th>Regular Expression</th>

<td></td>
<td></td>
<td></td>
<td>Unbound debug level</td>
</tr>
<tr>
<td>ta_file</td>
<td></td>
<td></td>
<td></td>
<td>Trust anchor file</td>
</tr>
</tbody>
</table>

**Configuration Option Descriptions**

**hosts**

Hosts specified in a hosts file will be resolved within the resolver itself. If a value of system is provided the system-specific file will be used.

**resolv**

The resolv.conf file specifies the nameservers to contact when resolving queries. If a value of system is provided the system-specific file will be used. If provided alongside explicit nameservers the nameservers contained within the resolv.conf file will be used after all others.

**nameserver**

An explicit nameserver can be specified which is used for resolving queries. If multiple nameserver lines are specified the first will be the primary with failover occurring, in order, to the other nameservers as backups. If provided alongside a resolv.conf file the nameservers explicitly specified will be used before all others.

**debug**

The debugging level for the unbound resolver. While there is no explicit range generally the higher the number the more debug is output.

**ta_file**

Full path to a file with DS and DNSKEY records in zone file format. This file is provided to unbound and is used as a source for trust anchors.

**Import Version**

This documentation was imported from Asterisk Version GIT-14-46b4e67
Asterisk 14 Configuration_res_statsd

<td></td>
<td></td>
</tr>
<tr>
<td><strong>buddy</strong></td>
<td>Manual addition of buddy to list</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configuration Option Descriptions**

**timeout**

Timeout (in seconds) on the message stack. Messages stored longer than this value will be deleted by Asterisk. This option applies to incoming messages only which are intended to be processed by the `JABBER_RECEIVE` dialplan function.

**autoprune**

Auto-remove users from buddy list. Depending on the setup (e.g., using your personal Gtalk account for a test) this could cause loss of the contact list.

**status**

Can be one of the following XMPP statuses:

- chat
- available
- away
- xaway
- dnd

**buddy**

Manual addition of buddy to the list. For distributed events, these buddies are automatically added in the whitelist as ‘owners’ of the node(s).

**Import Version**

This documentation was imported from Asterisk Version GIT-master-7d17164
Asterisk 14 Configuration_stasis
